Highlights .......................................................................................................................... 1

Background ......................................................................................................................... 5

Introduction ......................................................................................................................... 9

Chapter 1. Summary of Annual Data in State Client-Level Data Reporting: 2011-2014 ............................................................................................................. 13

Chapter 2. Characteristics of Children and Adolescents Aged 17 and Younger Receiving Mental Health Services: 2014 ................................................................................................. 19

Chapter 3. Characteristics of Young Adults Aged 18 to 25 Receiving Mental Health Services: 2014 ......................................................................................................................... 23

Chapter 4. Characteristics of Adults Aged 26 to 54 Receiving Mental Health Services: 2014 ................................................................................................................................. 27

Chapter 5. Characteristics of Older Adults Aged 55 and Older Receiving Mental Health Services: 2014 ......................................................................................................................... 31

Chapter 6. Characteristics of Individuals with Co-Occurring Substance Use and Mental Health Disorders Receiving Mental Health Services: 2014 ............................................................................ 35

Chapter 7. MH-TEDS Admissions and Discharges: 2014 ................................................................................................................................. 39

Tables ........................................................................................................................................ 43

Appendix A. MH-TEDS/MH-CLD Crosswalk Tables ................................................................................................................................. 253

Appendix B. MH-TEDS and MH-CLD 2011-2014 Reporting Methods and 2014 Reporting Period, by State and Jurisdiction ........................................................................................................... 263

Appendix C. MH-TEDS and MH-CLD Data Dictionary of Included Variables ................................................................................................................................. 265

Appendix D. SMI/SED Federal Definitions and CGAS/GAF Scale ................................................................................................................................. 279

Appendix E. Mental Health and Substance Use Diagnosis Codes ................................................................................................................................. 283

Appendix F. Terms and Acronyms .......................................................................................... 289
Appendix G. List of Contributors .........................................................291
LIST OF TABLES

Annual Data 2011-2014

1.1. Individuals, by mental health diagnosis: Number and percent distribution, 2011-2014 ................................................................. 44

1.2a. Individuals, by gender and age: Number and percent distribution, 2011-2014 .......... 45

1.2b. Individuals aged 17 and younger, by mental health diagnosis: Number and percent distribution, 2011-2014 .................................................. 46

1.2c. Individuals aged 18 to 25, by mental health diagnosis: Number and percent distribution, 2011-2014 ................................................................. 47

1.2d. Individuals aged 26 to 54, by mental health diagnosis: Number and percent distribution, 2011-2014 ................................................................. 48

1.2e. Individuals aged 55 and older, by mental health diagnosis: Number and percent distribution, 2011-2014 ................................................................. 49

1.3. Individuals, by race and ethnicity: Number and percent distribution, 2011-2014 .......... 50

1.4. Individuals, by marital status and living arrangement: Number and percent distribution, 2011-2014 ................................................................. 51

1.5. Individuals, by SMI/SED status, functioning (CGAS/GAF), and co-occurring mental health and substance use disorder: Number and percent distribution, 2011-2014 ................................................................. 52

1.6. Individuals aged 18 years and older, by employment status: Number and percent distribution, 2011-2014 ................................................................. 53

1.7. Individuals, by timing of admission and mental health service setting: Number and percent distribution, 2011-2014 ................................................................. 54

1.8. Individuals, by Census region, timing of admission, and mental health service setting: Number and percent distribution, 2013-2014 ................................................................. 55

1.9. Individuals, by Census region and mental health diagnosis: Number and percent distribution, 2014 ................................................................. 56
1.10. Individuals, by number of mental health diagnoses and any mention of mental health diagnosis: Number and percent distribution, 2011-2014 ...........................................57

1.11a. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Number, 2011 ........................................................................................................58

1.11b. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Column percent distribution, 2011 ........................................................................59

1.11c. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Row percent, 2011 ........................................................................................................60

1.12a. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Number, 2012 ........................................................................................................61

1.12b. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Column percent distribution, 2012 ........................................................................62

1.12c. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Row percent, 2012 ........................................................................................................63

1.13a. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Number, 2013 ........................................................................................................64

1.13b. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Column percent distribution, 2013 ........................................................................65

1.13c. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Row percent, 2013 ........................................................................................................66

1.14a. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Number, 2014 ........................................................................................................67

1.14b. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Column percent distribution, 2014 ........................................................................68

1.14c. Any mention of selected mental health diagnoses, by gender, race, and ethnicity: Row percent, 2014 ........................................................................................................69

1.15. Mental health individuals and U.S. population, by marital status and age group: Number and percent distribution, 2014 .................................................................70
## List of Tables (continued)

### Children and Adolescents (aged 17 and younger)

2.1a. Individuals aged 17 and younger, by mental health diagnosis, gender, race, and ethnicity: Number, 2014 .................................................................71

2.1b. Individuals aged 17 and younger, by mental health diagnosis, gender, race, and ethnicity: Column percent distribution, 2014 ........................................72

2.1c. Individuals aged 17 and younger, by mental health diagnosis, gender, race, and ethnicity: Row percent distribution, 2014 ...........................................73

2.2a. Individuals aged 17 and younger with SED, by mental health diagnosis, gender, race, and ethnicity: Number, 2014 ......................................................74

2.2b. Individuals aged 17 and younger with SED, by mental health diagnosis, gender, race, and ethnicity: Column percent distribution, 2014 ..........................75

2.2c. Individuals aged 17 and younger with SED, by mental health diagnosis, gender, race, and ethnicity: Row percent distribution, 2014 .................................76

2.3a. Individuals aged 17 and younger, by mental health diagnosis, living arrangement, SED status, and functioning score (CGAS): Number, 2014 ..................77

2.3b. Individuals aged 17 and younger, by mental health diagnosis, living arrangement, SED status, and functioning score (CGAS): Column percent distribution, 2014 ........78

2.3c. Individuals aged 17 and younger, by mental health diagnosis, living arrangement, SED status, and functioning score (CGAS): Row percent distribution, 2014 ........79

2.4a. Individuals aged 17 and younger with SED, by mental health diagnosis, living arrangement, and functioning score (CGAS): Number, 2014 ..................80

2.4b. Individuals aged 17 and younger with SED, by mental health diagnosis, living arrangement, and functioning score (CGAS): Column percent distribution, 2014 ....81

2.4c. Individuals aged 17 and younger with SED, by mental health diagnosis, living arrangement, and functioning score (CGAS): Row percent distribution, 2014 ........82

2.5a. Individuals aged 17 and younger, by mental health diagnosis, timing of admission, and mental health service setting: Number, 2014 ..............................................83
LIST OF TABLES (CONTINUED)

2.5b. Individuals aged 17 and younger, by mental health diagnosis, timing of admission, and mental health service setting: Column percent distribution, 2014 ....................84

2.5c. Individuals aged 17 and younger, by mental health diagnosis, timing of admission, and mental health service setting: Row percent distribution, 2014 ...................85

2.6a. Individuals aged 17 and younger with SED, by mental health diagnosis, timing of admission, and mental health service setting: Number, 2014 ..........................86

2.6b. Individuals aged 17 and younger with SED, by mental health diagnosis, timing of admission, and mental health service setting: Column percent distribution, 2014 .....................................................................................................................................87

2.6c. Individuals aged 17 and younger with SED, by mental health diagnosis, timing of admission, and mental health service setting: Row percent distribution, 2014 ............88

2.7. Individuals aged 17 and younger, by mental health service setting, SED status, and functioning score (CGAS): Number and percent distribution, 2014 .......................89

Younger Adults (aged 18 to 25)

3.1a. Individuals aged 18 to 25, by mental health diagnosis, gender, race, and ethnicity: Number, 2014 ......................................................................................................................90

3.1b. Individuals aged 18 to 25, by mental health diagnosis, gender, race, and ethnicity: Column percent distribution, 2014....................................................................................................91

3.1c. Individuals aged 18 to 25, by mental health diagnosis, gender, race, and ethnicity: Row percent distribution, 2014 .................................................................................................92

3.2a. Individuals aged 18 to 25 with SMI, by mental health diagnosis, gender, race, and ethnicity: Number, 2014 ........................................................................................................93

3.2b. Individuals aged 18 to 25 with SMI, by mental health diagnosis, gender, race, and ethnicity: Column percent distribution, 2014 .................................................................94

3.2c. Individuals aged 18 to 25 with SMI, by mental health diagnosis, gender, race, and ethnicity: Row percent distribution, 2014 .................................................................95

3.3a. Individuals aged 18 to 25, by mental health diagnosis, education, and marital status: Number, 2014 ..................................................................................................................96
3.3b. Individuals aged 18 to 25, by mental health diagnosis, education, and marital status: Column percent distribution, 2014 .................................................................97

3.3c. Individuals aged 18 to 25, by mental health diagnosis, education, and marital status: Row percent distribution, 2014 .................................................................98

3.4a. Individuals aged 18 to 25 with SMI, by mental health diagnosis, education, and marital status: Number, 2014 ..................................................................................99

3.4b. Individuals aged 18 to 25 with SMI, by mental health diagnosis, education, and marital status: Column percent distribution, 2014 .................................................100

3.4c. Individuals aged 18 to 25 with SMI, by mental health diagnosis, education, marital status: Row percent distribution, 2014 .................................................................101

3.5a. Individuals aged 18 to 25, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Number, 2014 ......................................................................102

3.5b. Individuals aged 18 to 25, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Column percent distribution, 2014 .........................103

3.5c. Individuals aged 18 to 25, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Row percent distribution, 2014 .......................104

3.6a. Individuals aged 18 to 25 with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Number, 2014 ..............................................................105

3.6b. Individuals aged 18 to 25 with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Column percent distribution, 2014 ...............106

3.6c. Individuals ages 18 to 25 with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Row percent distribution, 2014 .........................107

3.7a. Individuals aged 18 to 25, by mental health diagnosis and employment status: Number, 2014 ..............................................................................................................108

3.7b. Individuals aged 18 to 25, by mental health diagnosis and employment status: Column percent distribution, 2014 .............................................................................109

3.7c. Individuals aged 18 to 25, by mental health diagnosis and employment status: Row percent distribution, 2014 ..................................................................................110

LIST OF TABLES (CONTINUED)

4.2a. Individuals aged 26 to 54 with SMI, by mental health diagnosis, gender, race, and ethnicity: Number, 2014.................................................................................................................................124

4.2b. Individuals aged 26 to 54 with SMI, by mental health diagnosis, gender, race, and ethnicity: Column percent distribution, 2014........................................................................................................125

4.2c. Individuals aged 26 to 54 with SMI, by mental health diagnosis, gender, race, and ethnicity: Row percent distribution, 2014........................................................................................................126

4.3a. Individuals aged 26 to 54, by mental health diagnosis, education, and marital status: Number, 2014 .....................................................................................................................................................127

4.3b. Individuals aged 26 to 54, by mental health diagnosis, education, and marital status: Column percent distribution, 2014....................................................................................................................................128

4.3c. Individuals aged 26 to 54, by mental health diagnosis, education, and marital status: Row percent distribution, 2014...................................................................................................................................129

4.4a. Individuals aged 26 to 54 with SMI, by mental health diagnosis, education, and marital status: Number, 2014 .....................................................................................................................................................130

4.4b. Individuals aged 26 to 54 with SMI, by mental health diagnosis, education, and marital status: Column percent distribution, 2014....................................................................................................................................131

4.4c. Individuals aged 26 to 54 with SMI, by mental health diagnosis, education, and marital status: Row percent distribution, 2014...................................................................................................................................132

4.5a. Individuals aged 26 to 54, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Number, 2014....................................................................................................................133

4.5b. Individuals aged 26 to 54, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Column percent distribution, 2014........................................................................134

4.5c. Individuals aged 26 to 54, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Row percent distribution, 2014..................................................................................135

4.6a. Individuals aged 26 to 54 with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Number, 2014........................................................................................................136

4.6b. Individuals aged 26 to 54 with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Column percent distribution, 2014..............137
4.6c. Individuals aged 26 to 54 with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Row percent distribution, 2014 ..................138

4.7a. Individuals aged 26 to 54, by mental health diagnosis and employment status: Number, 2014 ..................................................................................................................................................................................................................................................................................139

4.7b. Individuals aged 26 to 54, by mental health diagnosis and employment status: Column percent distribution, 2014 ..................................................................................................................................................................................................................................................................................140

4.7c. Individuals aged 26 to 54, by mental health diagnosis and employment status: Row percent distribution, 2014 ..................................................................................................................................................................................................................................................................................141

4.8a. Individuals aged 26 to 54 with SMI, by mental health diagnosis and employment status: Number, 2014 ..................................................................................................................................................................................................................................................................................142

4.8b. Individuals aged 26 to 54 with SMI, by mental health diagnosis and employment status: Column percent distribution, 2014 ..................................................................................................................................................................................................................................................................................143

4.8c. Individuals aged 26 to 54 with SMI, by mental health diagnosis and employment status: Row percent distribution, 2014 ..................................................................................................................................................................................................................................................................................144

4.9a. Individuals aged 26 to 54, by mental health diagnosis, timing of admission, and mental health service setting: Number, 2014 ..................................................................................................................................................................................................................................................................................145

4.9b. Individuals aged 26 to 54, by mental health diagnosis, timing of admission, and mental health service setting: Column percent distribution, 2014 ..................................................................................................................................................................................................................................................................................146

4.9c. Individuals aged 26 to 54, by mental health diagnosis, timing of admission, and mental health service setting: Row percent distribution, 2014 ..................................................................................................................................................................................................................................................................................147

4.10a. Individuals aged 26 to 54 with SMI, by mental health diagnosis, timing of admission, and mental health service setting: Number, 2014 ..................................................................................................................................................................................................................................................................................148

4.10b. Individuals aged 26 to 54 with SMI, by mental health diagnosis, timing of admission, and mental health service setting: Column percent distribution, 2014 ..................................................................................................................................................................................................................................................................................149

4.10c. Individuals aged 26 to 54 with SMI, by mental health diagnosis, timing of admission, and mental health service setting: Row percent distribution, 2014 ..................................................................................................................................................................................................................................................................................150

4.11. Individuals aged 26 to 54, by mental health service setting, SMI status, and functioning score (GAF): Number and percent distribution, 2014 ..................................................................................................................................................................................................................................................................................151
LIST OF TABLES (CONTINUED)

Older Adults (aged 55 and older)

5.1a. Individuals aged 55 and older, by mental health diagnosis, gender, race, and ethnicity: Number, 2014 ........................................................................................................ 152

5.1b. Individuals aged 55 and older, by mental health diagnosis, gender, race, and ethnicity: Column percent distribution, 2014 ........................................................................................................ 153

5.1c. Individuals aged 55 and older, by mental health diagnosis, gender, race, and ethnicity: Row percent distribution, 2014 ........................................................................................................ 154

5.2a. Individuals aged 55 and older with SMI, by mental health diagnosis, gender, race, and ethnicity: Number, 2014 ........................................................................................................ 155

5.2b. Individuals aged 55 and older with SMI, by mental health diagnosis, gender, race, and ethnicity: Column percent distribution, 2014 ........................................................................................................ 156

5.2c. Individuals aged 55 and older with SMI, by mental health diagnosis, gender, race, and ethnicity: Row percent distribution, 2014 ........................................................................................................ 157

5.3a. Individuals aged 55 and older, by mental health diagnosis, education, and marital status: Number, 2014 ........................................................................................................ 158

5.3b. Individuals aged 55 and older, by mental health diagnosis, education, and marital status: Column percent distribution, 2014 ........................................................................................................ 159

5.3c. Individuals aged 55 and older, by mental health diagnosis, education, and marital status: Row percent distribution, 2014 ........................................................................................................ 160

5.4a. Individuals aged 55 and older with SMI, by mental health diagnosis, education, and marital status: Number, 2014 ........................................................................................................ 161

5.4b. Individuals aged 55 and older with SMI, by mental health diagnosis, education, and marital status: Column percent distribution, 2014 ........................................................................................................ 162

5.4c. Individuals aged 55 and older with SMI, by mental health diagnosis, education, and marital status: Row percent distribution, 2014 ........................................................................................................ 163

5.5a. Individuals aged 55 and older, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Number, 2014 ........................................................................................................ 164
5.5b. Individuals aged 55 and older, by mental health diagnostic category, living arrangement, SMI status, and functioning score (GAF): Column percent distribution, 2014 .................................................................165

5.5c. Individuals aged 55 and older, by mental health diagnosis, living arrangement, SMI status, and functioning score (GAF): Row percent distribution, 2014 ....................166

5.6a. Individuals aged 55 and older with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Number, 2014 .................................................................167

5.6b. Individuals aged 55 and older with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Column percent distribution, 2014 ............168

5.6c. Individuals aged 55 and older with SMI, by mental health diagnosis, living arrangement, and functioning score (GAF): Row percent distribution, 2014 ..................169

5.7a. Individuals aged 55 and older, by mental health diagnosis and employment status: Number, 2014 .................................................................170

Appendix C.

1. Number of states reporting data, MH-CLD 2011-2014 .................................................................275

2. Item percentage response rate, by state or jurisdiction: MH-CLD and MH-TEDS 2014 ................................................................................................................................276
This report presents results from the Mental Health Client Level Data (MH-CLD) and Mental Health Treatment Episode Set (MH-TEDS) for individuals receiving mental health treatment services in 2014, as well as selected data collection trends for such individuals from 2011 to 2014. The report provides information on mental health diagnoses, mental health treatment services, and demographic and substance use characteristics of individuals in mental health treatment in facilities that reported to individual state administrative data systems. One chapter is also devoted to characteristics of admissions to and discharges from mental health treatment, which can feature the same individual on multiple occasions.

- Forty-seven states and jurisdictions submitted 5,704,764 records for individuals receiving mental health services in 2014. Alaska, American Samoa, Federated States of Micronesia, Georgia, Guam, Maine, Marshall Islands, Michigan, New Hampshire, Palau, Virgin Islands, and West Virginia had submitted no data or incomplete data for 2014 as of May 08, 2015 [Table 1.1, Appendix B].

- Of the 5,704,764 eligible client-level records, 88 percent (or 4,999,556 records) had mental health diagnoses. These records form the basis for most tables in this report. However, individual records may not have data for all variables, so the analysis of specific variables may be based on a smaller number of individuals [Table 1.1].

State Client-Level Data Reporting: 2011-2014

For the 2011 reporting period, 19 states and jurisdictions reported that a total of 1,961,638 individuals had received mental health services; for the 2014 reporting period, seven states and jurisdictions reported that a total of 5,704,764 individuals had received mental health services [Table 1.1].

- More than 50 percent of the total individuals served were female in every reporting period between 2011 and 2014 [Table 1.2a].

- For the 2011 to 2014 reporting periods, Whites represented between 67 and 74 percent of the individuals served; Blacks or African Americans represented between 17 and 21 percent; and American Indians or Alaska Natives represented between 1 and 2 percent [Table 1.3].

- In every reporting period, depressive disorders were the most frequently reported any-mention mental health diagnoses, regardless of gender or ethnicity, and for every race except Blacks or African Americans in 2011-2012 and Asians in the 2012 reporting period. For these exceptions, schizophrenia and other psychotic disorders were the most frequently reported any-mention diagnoses [Tables 1.11a-1.14c].
Children and Adolescents Aged 17 and Younger Receiving Mental Health Services: 2014
A total of 1,514,755 children and adolescents were served in 2014 [Table 2.1a].

- Nineteen percent of females aged 17 and younger had reported diagnoses of depressive disorders [Table 2.1c].
- Twenty-nine percent of males aged 17 and younger had a diagnosis of ADD/ADHD, compared with only 15 percent of their female counterparts.

Young Adults Aged 18 to 25 Receiving Mental Health Services: 2014
A total of 576,361 young adults aged 18 to 25 were served in 2014 [Table 3.1a].

- Depressive disorders were the most frequently reported diagnoses among individuals served aged 18 to 25 of every racial and ethnic group [Table 3.1c].

Adults Aged 26 to 54 Receiving Mental Health Services: 2014
A total of 2,212,988 adults aged 26 to 54 were served in 2014 [Table 4.1a].

- In the 2014 reporting period, the most frequently reported diagnoses among males served aged 26 to 54 were schizophrenia and other psychotic disorders (26 percent) [Table 4.1c].
- Depressive disorders were the most frequently reported diagnoses for all races served aged 26 to 54, except Asians, ranging from 30 percent among Blacks or African Americans to 32 percent among Whites and American Indians or Alaska Natives. Among Asians served aged 26 to 54, the most frequently reported diagnoses were schizophrenia and other psychotic disorders (34 percent).

Older Adults Aged 55 and Older Receiving Mental Health Services: 2014
A total of 693,277 adults aged 55 and older were served in 2014 [Table 5.1a].

- Among females served aged 55 years and older in 2014, the most frequently reported diagnoses were depressive disorders (41 percent) and schizophrenia and other psychotic disorders (21 percent) [Table 5.1c].
- Depressive disorders were the most frequently reported diagnoses for individuals served aged 55 and older of all races except Blacks or African Americans, ranging from 36 percent of American Indians or Alaska Natives to 49 percent of Asians. Among Black or African American individuals, the most frequently reported diagnoses were schizophrenia and other psychotic disorders (40 percent).

Individuals with Co-occurring Mental Health and Substance Use Disorders Receiving Mental Health Services: 2014
A total of 741,923 individuals aged 12 and older with co-occurring mental health and substance use disorders were served in 2014 [Table 6.1a].
During the 2014 reporting period, the most frequently reported diagnoses among males served who had co-occurring mental health and substance use disorders were schizophrenia and other psychotic disorders (25 percent); for females, they were depressive disorders (32 percent) [Table 6.1c].

Depressive disorders were the most frequently reported diagnoses for individuals served who had co-occurring non-dependent opioid use (37 percent), alcohol dependence (35 percent), opioid dependence (34 percent), and non-dependent alcohol use (30 percent) [Table 6.3c].

MH-TEDS Admissions and Discharges: 2014

In the 2014 reporting period, six states (Connecticut [adults only], the District of Columbia, Louisiana, Mississippi, Oklahoma, and Puerto Rico) reported a total of 403,670 admissions to MH-TEDS [Table 7.1].

Of those that were admitted to treatment prior to the 2014 reporting period, 59 percent received treatment in community programs, 42 percent received treatment in institutions under the justice system, and 32 percent received treatment in state psychiatric hospitals.

More than half (53 percent) of admissions for individuals in treatment during the 2014 reporting period occurred prior to the reporting period [Table 7.2b].

There were more male than female admissions for ADD/ADHD, conduct disorder, and oppositional defiant disorder. There were more female than male admissions for adjustment disorders, anxiety disorders, bipolar disorders, and depressive disorders [Table 7.3a and 7.10a].
Mental health services data are currently collected for and reported to the Substance Abuse and Mental Health Services Administration’s (SAMHSA’s) Center for Behavioral Health Statistics and Quality (CBHSQ). The State Mental Health Agencies (SMHAs) are the state entities with primary responsibility for reporting the data in accordance with the reporting terms and conditions of the Behavioral Health Services Information System (BHSIS) Agreements funded by SAMHSA. The BHSIS Agreement stipulates that states and jurisdictions submit Uniform Reporting System (URS) data and client-level data on the first of December each year, in compliance with Mental Health Block Grant reporting requirements (42 U.S.C. § 300x-6).

URS data reporting started in early 2000 in an effort spearheaded by SAMHSA’s Center for Mental Health Services (CMHS) to collect both system performance measures and client outcomes at an aggregate level. Collection of client-level data came later.

In 2008, SAMHSA, through CMHS tested the feasibility of transitioning from aggregate reporting of SAMHSA’s mental health National Outcome Measures (NOMs)¹ to individual-level data reporting. This led to the development of the Mental Health Client-level Data (MH-CLD) reporting method. The development was supported by Data Infrastructure Grants (DIGs), which were a vehicle through which states and jurisdictions received financial and technical assistance from SAMHSA to assist in their capacity-building effort to meet the Block Grant reporting requirements.

The general framework for the MH-CLD involves a compilation of the demographic, clinical, and outcome data of individuals served by the SMHA within a state-defined 12-month reporting period. States may choose the calendar year or the state fiscal year for their reporting period. “Individuals served” is defined as all enrolled individuals who received mental health and support services, including screening, assessment, crisis services, and telemedicine from programs operated or funded by the SMHA during the reporting period.

Two data sets are submitted each reporting period: Basic Client Information (BCI) is due each December 1st and the State Hospital Readmission (SHR) is due March 1st of the following year. Data from these two data sets inform five mental health NOMs: Access to Services/Capacity, Stability in Housing/Residential Status, 30-day and 180-day Readmission to State Hospital, Adult Employment or Children’s School Attendance and Education Level, and Criminal Justice Involvement. Five additional NOMs—Social Connectedness, Decreased Mental Illness Symptomatology, Perception of Care, Cost Effectiveness, and Use of EBP Practices—have not been converted into client-level data reporting and continue to be captured in the URS. Data are reported in accordance with the HIPAA rules for non-Protected Health Information (non-PHI).

¹ National outcome measures can be found at http://wwwdasis.samhsa.gov/dasis2/noms/noms_attch1.pdf.
In 2010, SAMHSA, through CBHSQ, began a parallel effort of testing the feasibility of building a national behavioral health database that integrates both mental health and substance use data using a uniform platform for data reporting. This effort led to the integration of mental health data into the well-established system of reporting for substance use client-level data, known as the Treatment Episode Data Set (TEDS).\(^2\) To enable reporting of mental health client data to TEDS, the system was modified to incorporate data elements that capture the characteristics unique to the mental health services system and the individuals receiving mental health services. These characteristics include, among others, the extended period of time that an individual may be engaged in treatment, the recovery process, and the simultaneous receipt of different types of services from different service providers, etc. This method of reporting mental health data at the individual level is referred to as the Mental Health Treatment Episode Data Set (MH-TEDS).

Unlike MH-CLD, MH-TEDS is structured around treatment events, that is, admissions and discharges from specific service settings. Admission and discharge records can be linked to track treatment episodes and the treatment services received by individuals. Thus, with MH-TEDS, both the individual client and the treatment episode can serve as a unit of analysis, whereas with MH-CLD the client is the sole unit of analysis. The common TEDS platform in which both the substance use and mental health data are reported enhances the ability to report data on people with co-occurring mental health and substance use disorders. It also offers optional data fields for individuals with mental illness that are not captured in MH-CLD, such as referral source, details on criminal justice referral, income sources, and health insurance.

MH-TEDS is a compilation of demographic, substance use, mental health, clinical, legal, and socioeconomic characteristics of individuals who are primarily receiving publicly-funded mental health and/or substance use services. MH-TEDS data support program performance measurement and management goals. The same set of mental health NOMs enumerated under MH-CLD is also supported by MH-TEDS. Thus, while both MH-TEDS and MH-CLD collect similar client-level data, the collection methodology differs.

National mental health client-level data reporting was launched in 2011, when MD-CLD was the only reporting method available. States, the District of Columbia, and U.S. jurisdictions including Puerto Rico, the U.S. Virgin Islands, and the six Pacific Jurisdictions (American Samoa, Guam, the Republic of the Marshall Islands, the Federated States of Micronesia, the Commonwealth of the Northern Mariana Islands, and Palau) with the capacity to report client-level data were encouraged to do so. The number of states reporting MH-CLD and MH-TEDS data increased from 19 in 2011 to 32 in 2012 and 46 in 2013 to 47 in 2014. See Appendix B for the number of states that used each reporting method. The Northern Mariana Islands was the first Pacific Jurisdiction to report data (for the 2012 reporting period), and it is the only Pacific jurisdiction to do so as of this report’s publication date. While the number reporting client-level data has increased, it is also important

to note that the level of reporting varies. Two states (New York and Tennessee) are able to submit data only for a subset of the total number of individuals that they served during a reporting period.

Beginning in the 2014 reporting period, states could choose which method to use for data reporting, either MH-CLD or MH-TEDS. Forty-two states chose MH-CLD, four states (Oklahoma, Louisiana, Mississippi, and Connecticut) and one jurisdiction (Puerto Rico) chose MH-TEDS, and Washington, DC, which was reporting client-level data for the first time, selected to use MH-TEDS. However, because Connecticut uses both methods (MH-CLD to report data for children and adolescents and MH-TEDS to report data for adults), a total of 47 states and jurisdictions reported client-level data for the 2014 reporting period.

In summary, this report presents the client-level data reported for the 2011 through 2014 reporting periods. Data from all four reporting periods are presented in Chapter 1; only 2014 data are used in succeeding chapters. Data for the 2011 through 2013 reporting periods were collected using the MH-CLD while the 2014 data are derived from a reconciliation of the two reporting methods (MH-TEDS and MH-CLD) using the individual as the unit of analysis.

See Appendix A for a crosswalk of data fields collected in MH-TEDS and MH-CLD.
INTRODUCTION

This report presents mental health client-level data submitted for the 2011 through 2014 reporting periods using the Mental Health Client-Level Data (MH-CLD) and the Mental Health Treatment Episode Data Set (MH-TEDS). This report provides information on the demographics, characteristics, and outcomes of individuals served by the State Mental Health Agencies (SMHAs) for these four reporting periods, with particular focus on the most recent reporting period. The Substance Abuse and Mental Health Services Administration (SAMHSA) has provided support to states to build capacity to collect and report client-level data.

Methodology

Reconciling data from MH-TEDS and MH-CLD

Both the MH-TEDS and MH-CLD include individuals served through the SMHA during the state-defined 12-month reporting period. Most states selected to use the state fiscal year, which, for the 2014 reporting period, usually ran from July 1, 2013, through June 30, 2014, but some states define their fiscal year differently. (See Appendix B for details.)

MH-CLD contains one record for each individual served. Data items are populated by the states based on the status of the individual either at the start and end of the state’s reporting period or the most recently available data. The MH-TEDS dataset contains one record for each admission to and discharge from a particular service type/setting (referred to as a treatment episode) within the client’s treatment continuum during the reporting period. Data collected from MH-TEDS admission records and update/discharge records are stored as two separate datasets, which can be linked using a HIPAA-compliant, non-protected health information unique client identifier located in both files. Linking the records allows for the creation of a single client record comparable to the MH-CLD format.

The general MH-CLD framework was applied to the MH-TEDS dataset. An analytic file was developed by transposing the admission and discharge MH-TEDS records into a client-level file. The final step crosswalked MH-TEDS variables to MH-CLD variables. (See Appendix A for details).

The process of creating an individual record using the MH-TEDS data allowed for combined reporting of the individuals reported in the MH-TEDS and MH-CLD datasets. Tables in Chapters 1 through 6 of this report use individuals as the unit of analysis for the combined data from MH-TEDS and MH-CLD. Tables in Chapter 7 report on the MH-TEDS data at the treatment episode level.

Selection of reporting variables

MH-TEDS and MH-CLD collect a variety of data items including demographics (e.g., gender, race, and ethnicity); National Outcome Measures (NOMs) such as living arrangements and employment status; and other clinical measures (e.g., co-occurring mental health and substance use disorders).
The data collection protocol for the NOMS on criminal justice involvement and school attendance were introduced in client-level reporting in early 2013, and so were first submitted for the 2014 reporting period. However, because valid data were reported for only 40 percent of the individuals served, arrest data were excluded from this report. See Appendix C for a description of the variables and Appendix D for the federal definitions of serious mental illness (SMI) and serious emotional disturbance (SED) and for CGAS/GAF scale definitions.

Mental health diagnoses are reported in the MH-TEDS and MH-CLD as either ICD-9-CM or DSM-IV codes. Up to three mental health diagnostic codes may be reported for each client. For this report, diagnostic categories were categorized based on the Clinical Classification Software (CCS). The mental health section of the CCS has 15 diagnostic categories and 25 subcategories; in all, thirteen such categories or subcategories were selected for tabulation, with all other mental health diagnoses grouped to “other” mental health diagnoses for a given table. The frequency distribution of the reported diagnoses for all individuals served and the specific diagnoses included in the federal definition of SMI and SED informed the selection of the most appropriate CCS categories or subcategories used in this report. See Appendix E.

The full list of thirteen specific mental health diagnoses used in this report is: adjustment disorders; anxiety disorders; attention deficit disorder and attention deficit hyperactivity disorder (ADD/ADHD); conduct disorder; delirium, dementia, and amnestic and other cognitive disorders (delirium/dementia); bipolar disorders; depressive disorders; oppositional defiant disorder; personality disorders; pervasive developmental disorders; schizophrenia and other psychotic disorders; alcohol-related disorders; and substance-related disorders.

All other mental disorders are grouped together as “other mental health disorders.” There is also a category of no diagnosis or deferred diagnosis. The list of tabulated mental health diagnoses (and hence the diagnoses grouped together as “other”) varies somewhat by age group. For example, conduct disorder, oppositional defiant disorder, and pervasive developmental disorders, which are all typically identified in individuals aged 17 or younger, are only included on tables showing data for children and adolescents while delirium/dementia only appears in tables showing data for older adults.

Records with partially complete data have been retained in this report. For example, an entire client record is not removed from the report because a single data item is missing. When records include missing or invalid data for a specific variable, those records are excluded from tabulations of that variable. The total number of records on which a percentage distribution is based is reported in each table.
Stratification of reporting population and subgroups

In general, there are two levels of data reporting: (1) the entire population with each age category, and (2) the subgroup population of individuals with or at risk for serious emotional disturbance (SED) or serious mental illness (SMI). On select tables, regional breakdowns of the data using the four Census regions\(^3\) are also presented.

Because different stages of life are associated with distinct forms of mental and behavioral disorders and with distinctive treatment service utilization patterns, this report examines the characteristics of individuals receiving mental health services by the following age groups: children and adolescents (aged 17 and younger), young adults (aged 18 to 25), adults (aged 26 to 54), and older adults (aged 55 and older). Accordingly, Chapters 2 through 5, which focus on specific age groups, include age-specific sets of mental health diagnoses.\(^4\)

Additionally, this report includes the subpopulation of individuals with co-occurring mental and substance use disorders. For this subpopulation, the report includes individuals aged 12 years and older to match the population used in the substance use TEDS reports. Determination of individuals with a co-occurring mental health and substance use disorder was based on state report of a dichotomous variable in the data set called “Co-occurring substance use and mental health problems.” In accordance with the guidelines for completing this field, an individual had to have either had a substance use diagnosis, been identified with a substance use disorder through the use of a screening or assessment tool, or been enrolled in a substance use treatment program.

Identification of individuals with a serious mental illness (SMI) or serious emotional disturbance (SED) is based on the state definition for SMI and SED and is reported as a single dichotomous variable—SMI/SED status. Individuals aged 17 and younger who are indicated as having SED or being at risk of SED in the dataset are included in the SED subpopulation while individuals aged 18 and older who are indicated as having an SMI are included in the SMI subpopulation. Exceptions may exist for a few states where young adults (ages 18 to 21) continue to receive mental health services from the state’s Child Mental Health System. They are included in the SED subpopulation as reported by the state.

Limitations

- For both MH-TEDS and MH-CLD, states report only individuals served through the SMHA during the state-defined 12-month reporting period. These data do not represent the total national demand for mental health treatment or describe the mental health status of the national

---

\(^4\) For example, individuals with a Mental Health Diagnosis One of Schizophrenia and Other Psychotic Disorders are grouped with “Other” for persons aged 17 and younger in chapter 2. While this information is of recent interest, this diagnostic group is not reported separately for this age group. Only 0.7 percent of all individuals served in this age group reported Schizophrenia and Other Psychotic Disorders as a diagnosis.
population. In addition, New York and Tennessee report only a proportion of the total individuals served through their SMHAs.

- Up to three mental health diagnoses per individual can be reported to MH-TEDS or MH-CLD (Mental Health Diagnoses One, Two, and Three). These diagnoses may not represent a complete enumeration of all diagnoses for individuals served. Moreover, Florida has data collection protocols that limit reporting to only one or two diagnoses.

- Except for a few tables presented in Chapter 1, this report uses the “first-mention” mental health diagnosis as the individual grouping variable. About 90 percent of all individuals served in the 2014 data have at least one mental health diagnosis, while 27 percent have a second mental health diagnosis, and 20 percent have a third mental health diagnosis.
Chapter 1
Summary of Annual Data in State Client-Level Data Reporting: 2011-2014

This chapter provides a brief background on state reporting of mental health client-level data and a summary of the data submitted for the 2011 through 2014 reporting periods.

In 2010, SAMHSA, through the Center for Mental Health Services (CMHS), announced the availability of Data Infrastructure Grants (DIGs) to support the states, the District of Columbia, and other jurisdictions in building capacity to report client-level data. The client-level data encompass reporting of five mental health National Outcome Measures (NOMs): Access to Services/Capacity, Stability in Housing/Residential Status, Criminal Justice Involvement, Adult Employment/Children’s School Attendance and Education Level, and 30-day and 180-day Readmission to State Hospital. The number of states (which includes Washington, DC; Puerto Rico; and the Northern Mariana Islands) reporting client-level data has gradually increased: 19 states reported 2011 data, 32 reported 2012 data, 46 reported 2013 data, and 47 reported 2014 data.

For the 2011 through 2013 reporting periods, states could use only the Mental Health Client-Level Data (MH-CLD). As of the 2014 reporting period, states could choose to use either the MH-CLD or the Mental Health Treatment Episode Data Set (MH-TEDS). For this report, the MH-TEDS data reported by 6 states for the 2014 reporting period were reconciled with data collected from the 42 states using the MH-CLD. (Note: Connecticut used both methods, MH-CLD for reporting data on children and adolescents and MH-TEDS for reporting data on adults.)

Because of the changing number of states submitting data for each reporting period, caution must be used when comparing data over time. Apparent increases, changes, or other variations across reporting periods may be more a function of changes in the mix of states reporting than of actual changes in client characteristics over time.

All data tables represent individuals who received publicly-funded mental health services—individuals served—through the auspices of the State Mental Health Agencies (SMHAs).

Individuals Served

Table 1.1. For the 2011 reporting period, 19 states reported that a total of 1,961,638 individuals had received mental health services; for the 2014 reporting period, 47 states reported that a total of 5,704,764 individuals had received mental health services.  

---

5 Henceforth, “states” will refer to the 50 states, Washington, DC, and other jurisdictions, which include Puerto Rico, the U.S. Virgin Islands, and the six Pacific Jurisdictions.

6 Data were not submitted or were incomplete for one or more years in some states or jurisdictions.
Among individuals reported to have received services for the 2011 to 2014 reporting periods, between 38 and 44 percent had first-mention mental health diagnoses of mood disorders, including bipolar disorders (15 to 19 percent) and depressive disorders (23 to 25 percent); between 11 and 13 percent had first-mention mental health diagnoses of schizophrenia and other psychotic disorders; and 10 to 11 percent had first-mention mental health diagnoses of anxiety disorders.

The following paragraphs summarize data on NOMs and clinical measures for all individuals, presented by demographic characteristics and mental health diagnoses. Overall, the distributions were relatively consistent across all characteristics for all four reporting periods.

**Gender**

- *Table 1.2a.* More than 50 percent of the total individuals served were female in every reporting period between 2011 and 2014 (52 percent in 2011 and 2012, 51 percent in 2013 and 2014).

**Age and Mental Health Diagnoses by Age Group**

- *Table 1.2a.* For the 2011 through 2014 reporting periods, 28 to 30 percent of individuals served were aged 17 and younger, 12 percent were aged 18 to 25 (in all four reporting periods), 44 to 47 percent were aged 26 to 54, and 13 to 14 percent were aged 55 and older.

*Tables 1.2b-1.2e.* Among individuals served in specific age groups, the most frequently reported diagnoses were relatively consistent across the four reporting periods.

- Among individuals served aged 17 and younger, the most frequently reported diagnoses over the four reporting periods were ADD/ADHD (ranging from 21 to 26 percent), mood disorders (ranging from 19 to 22 percent), and adjustment disorders (ranging from 14 to 16 percent).

- Among individuals served aged 18 to 25, the most frequently reported diagnoses over the four reporting periods were mood disorders (ranging from 42 to 49 percent), anxiety disorders (ranging from 11 to 12 percent), and schizophrenia and other psychotic disorders (ranging from 9 to 10 percent).

- Among individuals served aged 26 to 54, the most frequently reported diagnoses over the four reporting periods were mood disorders (ranging from 47 to 54 percent), schizophrenia and other psychotic disorders (ranging from 16 to 18 percent), and anxiety disorders (ranging from 10 to 11 percent).

- Among individuals served aged 55 and older, the most frequently reported diagnoses over the four reporting periods were mood disorders (ranging from 46 to 53 percent), schizophrenia and other psychotic disorders (ranging from 22 to 24 percent), and anxiety disorders (ranging from 7 to 8 percent).

---

7 Throughout this report the term “diagnosis” refers to the first reported mental health diagnosis on the client-level data record. This is only the first of up to three diagnoses per client qualifying as a mental health diagnosis, as recorded by the reporting agency. While these first-mentioned mental health diagnoses are mutually exclusive, a client reported to receive a first-mention diagnosis of, for example, depressive disorders, may also have received a second-mention diagnosis of anxiety disorder, and a third-mention diagnosis of schizophrenia or other psychotic disorder.
Ethnicity

- *Table 1.3.* Between 14 and 16 percent of all individuals served over the four reporting periods were of Hispanic origin (any race).

Race

- *Table 1.3.* For the 2011 to 2014 reporting periods, Whites represented between 67 and 74 percent of the individuals served; Blacks or African Americans represented between 17 and 21 percent; and American Indians or Alaska Natives, Asians, Native Hawaiians or other Pacific Islanders, and other groups represented the remaining 8 to 12 percent.

Marital Status

- *Table 1.4.* Among individuals served aged 18 and older, more than one half reported never being married in every reporting period between 2011 and 2014 (ranging from 51 to 57 percent); less than one fifth (ranging from 16 to 19 percent) reported being currently married during those reporting periods.

- *Table 1.15.* In the 2014 reporting period, 18 percent of individuals served aged 26 to 54 were currently married. In contrast, 56 percent of people in the U.S. population in that age group were currently married in 2014.

Living Arrangements

- *Table 1.4.* Over the four reporting periods, a majority of individuals served reported living in a private residence (ranging from 83 to 88 percent), while only 3 percent in each reporting period reported being homeless.

SMI/SED Status

- *Table 1.5.* In every reporting period from 2011 to 2014, about one half of the individuals served were adults with serious mental illness (SMI) (ranging from 49 to 55 percent) and about one fifth were children and adolescents with or at risk for serious emotional disturbance (SED) (ranging from 20 to 22 percent).

Employment

- *Table 1.6.* Among individuals served aged 18 and older in the 2011 to 2014 reporting periods, between 17 and 19 percent were employed, 29 to 37 percent were unemployed, and 47 to 52 percent were “not in labor force.”

---

8 Data on Specific Hispanic or Latino Origin (hereafter referred to as of Hispanic origin) are also presented for a subset of states that reported this information.

9 Individuals of “Other” race includes individuals who reported two or more races or some other race.
Timing of Admission

- *Table 1.7.* The population of individuals served was composed of similar proportions of individuals who were newly admitted to treatment\(^{10}\) (ranging from 44 to 49 percent) and individuals who were continuing treatment\(^{11}\) (ranging from 51 to 56 percent) over the four reporting periods.

Service Setting

- *Table 1.7.* For the 2011 to 2014 reporting periods, a majority of individuals received mental health services from community-based programs (ranging from 98 to 99 percent).

Regional Distributions

*Table 1.8.* Nearly one third (about 32 percent) of all individuals reported were in the South for both the 2013 and 2014 reporting periods, one quarter (27 and 26 percent) were in the West, one fifth were in the Northeast (22 and 20 percent), and another one fifth were in the Midwest (18 and 22 percent).

- In both the 2013 and 2014 reporting periods, individuals who were newly admitted to treatment were most frequently reported in the South (39 percent in both reporting periods).\(^{12}\) The West region was the region with the second highest proportions of individuals who were newly admitted (27 and 26 percent, respectively).

- Regional patterns of service setting varied from those values for individuals served in non-community program settings in the 2013 and 2014 reporting periods: of individuals receiving services in state psychiatric hospitals, a larger proportion were reported in the South (50 and 45 percent, respectively) than in the West (11 and 14 percent, respectively); however, of individuals receiving services in other psychiatric inpatient\(^{13}\) service settings, a larger proportion were reported in the West (44 and 41 percent, respectively) than in the South (28 percent each in both reporting periods) and Northeast (9 and 8 percent, respectively).

*Table 1.9.* While the distribution of mental health diagnoses was relatively similar across U.S. Census Regions, some variations exist.

- In the 2014 reporting period, mood disorders (bipolar and depressive disorders) were most frequently reported in the South (42 percent) and least frequently in the Northeast (30 percent).

- In the 2014 reporting period, anxiety disorders were more frequently reported in the West (14 percent) and the Midwest (12 percent) than in the South and Northeast (8 percent each).

---

\(^{10}\) Individuals who were newly admitted to treatment either (1) had not previously received a service and started receiving services during the reporting year or (2) had previously received a service, were discharged or inactive for an extended period of time, and resumed receiving services during the reporting period.

\(^{11}\) Individuals who were continuing treatment were admitted prior to the start of the reporting period and received a service during the reporting period.

\(^{12}\) South region results are influenced by database upgrades in Florida and Tennessee that caused greater numbers of individuals to be reported.

\(^{13}\) Examples of “other psychiatric inpatient” facilities include psychiatric wards in private or general hospitals.
Any-Mention Mental Health Diagnoses, by Gender, Race, and Ethnicity

Tables 1.11a-1.14c present the number and percentage distribution of individuals who received any mention—whether first, second, or third—of the listed mental health diagnoses by gender, race, and ethnicity for the 2011, 2012, 2013, and 2014 reporting periods. Any differences across reporting periods should be interpreted with caution. Variations may be more of a function of the mix and number of reporting states than of actual differences.

- In every reporting period, depressive disorders were the most frequently reported any-mention mental health diagnoses, regardless of gender or ethnicity, and for every race except Blacks or African Americans in the 2011 reporting period and Blacks or African Americans and Asians in the 2012 reporting period. For these three exceptions, schizophrenia and other psychotic disorders were the most frequently reported any-mention diagnoses.

- In every reporting period, the most frequently reported any-mention mental health diagnoses for females and males were depressive disorders, but the proportions among females (ranging from 33 to 35 percent) were consistently higher than among males (ranging from 19 to 21 percent).

- The most frequently reported any-mention diagnoses among individuals of both non-Hispanic and Hispanic origin were consistently depressive disorders, with similar proportions receiving the diagnosis over the four reporting periods (ranging from 27 to 29 percent among both groups).
Chapter 2
Characteristics of Children and Adolescents Aged 17 and Younger Receiving Mental Health Services: 2014

This chapter presents data on individuals aged 17 and younger who received mental health services through the SMHAs in the 2014 reporting period. Data on NOMs and clinical measures are presented by demographic characteristics and mental health diagnoses for all children and adolescents. Characteristics for the subpopulation of children and adolescents with or at risk for serious emotional disturbance (SED) are presented only where they differ from the characteristics of all children and adolescents.

The mental health diagnoses presented in the chapter tables are adjustment disorders; anxiety disorders; attention deficit disorder and attention deficit hyperactivity disorder (ADD/ADHD); conduct disorder; mood disorders—bipolar disorders and depressive disorders; oppositional defiant disorder; pervasive developmental disorders; and other disorders. Four of these—ADD/ADHD, conduct disorder, oppositional defiant disorder, and pervasive developmental disorders—are typically identified in childhood.

Children and Adolescents Served

Table 2.1a. For the 2014 reporting period, states reported a total of 1,514,755 children and adolescents served (27 percent of all individuals). About three quarters (74 percent) of these children and adolescents were reported to have or be at risk of SED.

During this period, the data indicate that mental health diagnoses for all children and adolescents differed across categories for several characteristics, including gender, race, ethnicity, living arrangements, SED status, level of functioning, timing of admission, and service setting.

A comparison of the findings for all children and adolescents and the subpopulation of children and adolescent with SED found similar patterns in the distribution of characteristics for both populations during the 2014 reporting period.

Gender

Tables 2.1a-2.2c. In the 2014 reporting period, the most frequently reported diagnoses differed by gender among individuals served aged 17 and younger.

- Among males aged 17 and younger served in the 2014 reporting period, the most frequently reported diagnoses were ADD/ADHD (29 percent), adjustment disorders (14 percent), and anxiety disorders (10 percent).
- Among females aged 17 and younger served in the 2014 reporting period, the most frequently reported diagnoses were adjustment disorders (21 percent), depressive disorders (19 percent), and anxiety disorders (16 percent).
• Males aged 17 and younger had a diagnosis of ADD/ADHD almost twice as frequently as their female counterparts (29 vs. 15 percent) in the 2014 reporting period.

**Race**

• *Tables 2.1a-2.c.* The most frequently reported diagnoses among individuals served aged 17 and younger varied by race in the 2014 reporting period. Adjustment disorders were reported most frequently among American Indians or Alaska Natives (20 percent) and Native Hawaiians or Other Pacific Islanders (19 percent), depressive disorders among Asians (20 percent), and ADD/ADHD among Blacks or African Americans (30 percent) and Whites (23 percent).

**Ethnicity**

• *Tables 2.1a-2.c.* Among individuals served of Hispanic origin aged 17 and younger, diagnoses of ADD/ADHD and adjustment disorders were equally likely (18 percent each).

**Living Arrangements**

• *Tables 2.3a-2.4c.* The most frequently reported diagnoses among individuals served aged 17 and younger who were homeless or in foster care was adjustment disorders (32 and 26 percent, respectively).

  • Among individuals served aged 17 and younger who were living in a private residence, the most frequently reported diagnosis was ADD/ADHD (24 percent).

  • Among individuals served aged 17 and younger who were in residential care, the most frequently reported diagnoses were bipolar disorders (24 percent).

**SED Status**

• *Tables 2.3a-2.4c.* The most frequently reported diagnosis among individuals served aged 17 and younger with SED was ADD/ADHD (25 percent), while the most frequently reported diagnoses among individuals served aged 17 and younger without SED who received services were adjustment disorders (28 percent).

**Level of Functioning**

• *Tables 2.3a-2.4c.* The most frequently reported diagnoses among individuals served aged 17 and younger who had a lower level of functioning (i.e., a Children’s Global Assessment Scale (CGAS) score of 1 to 50 on the 100-point scale) were depressive disorders (20 percent).

  • The most frequently reported diagnosis among individuals served aged 17 and younger who had a higher level of functioning (i.e., a CGAS score of 51 to 100) was ADD/ADHD (22 percent).

**Timing of Admission**

• *Tables 2.5a-2.6c.* The most frequently reported diagnoses among individuals served aged 17 and younger in the 2014 reporting period who were newly admitted to treatment were adjustment disorders (21 percent).
• The most frequently reported diagnosis among individuals served aged 17 and younger who were continuing treatment during that reporting period was ADD/ADHD (28 percent).

**SED Status and Level of Functioning, by Service Setting**

Table 2.7. SED status and level of functioning varied by service setting among individuals served aged 17 and younger. It should be noted that individuals may have received services in more than one setting during the reporting period, and therefore may be counted in multiple rows in the service setting section of Table 2.7.

• Among individuals served aged 17 and younger in a community-based program setting in the 2014 reporting period, 75 percent had SED compared with more than 80 percent of individuals served aged 17 and younger at a state psychiatric hospital, residential treatment center, or other psychiatric inpatient setting.

• For the 2014 reporting period, individuals served aged 17 and younger who had higher levels of functioning (i.e., a CGAS score of 51 to 100) were mostly served in community-based programs and residential treatment centers. Of individuals served age 17 and younger who had higher levels of functioning, 53 percent received services in community-based programs and 41 percent received services in residential treatment centers compared with 29 percent of those treated in other psychiatric inpatient setting and 20 percent of those treated in state psychiatric hospitals.
This chapter presents data on young adults aged 18 to 25 who received mental health services through the SMHAs in the 2014 reporting period. Data on NOMs and clinical measures for all young adults are presented by demographic characteristics and mental health diagnoses. Characteristics for the subpopulation of young adults with a serious mental illness (SMI) are presented only where they differ from the characteristics of all young adults who received mental health services in the 2014 reporting period.

The mental health diagnoses presented in the chapter tables are adjustment disorders; anxiety disorders; ADD/ADHD; mood disorders—bipolar disorders and depressive disorders; personality disorders; schizophrenia and other psychotic disorders; and other disorders.

Young Adults Served

Table 3.1a-c and 3.2a. For the 2014 reporting period, states reported a total of 576,361 individuals served aged 18 to 25 (10 percent of all individuals served). Nearly two thirds (63 percent) of these individuals were reported to have SMI.

During that period, the data show mental health diagnoses among young adults differed across categories for several characteristics, including gender, living arrangements, detailed not in labor force, and services setting. Mental health diagnoses were largely similar across race, ethnicity, education level, marital status, SMI status, level of functioning, employment status, and timing of admission.

A comparison of the findings for all young adults and the subpopulation of young adults with SMI found similar patterns in the distribution of characteristics for both populations during the 2014 reporting period, but there were some differences depending on gender, race, and service setting.

Gender

- Tables 3.1a-3.2c. Among males aged 18 to 25 served during the 2014 reporting period, the most frequently reported diagnoses were bipolar disorders (21 percent), depressive disorders (20 percent), and other unspecified disorders (18 percent).
- Among females aged 18 to 25 served, the most frequently reported diagnoses were depressive disorders (33 percent), bipolar disorders (23 percent), and anxiety disorders (17 percent).

These patterns in variation differed slightly among individuals served aged 18 to 25 with SMI during the 2014 reporting period.

- Among males served aged 18 to 25 with SMI, the most frequently reported diagnoses were bipolar disorders (26 percent), schizophrenia and other psychotic disorders (23 percent), and depressive disorders (22 percent).
Among females served aged 18 to 25 with SMI, the most frequently reported diagnoses were depressive disorders (37 percent) and bipolar disorders (28 percent).

**Race and Ethnicity**

- Depressive disorders were the most frequently reported diagnoses among individuals served aged 18 to 25 of every racial and ethnic group.
- By race, the second most frequently reported diagnoses for individuals served aged 18 to 25 were bipolar disorders among Whites (24 percent), Blacks or African Americans (21 percent), Native Hawaiians or other Pacific Islanders (20 percent), and American Indians or Alaska Natives (17 percent), while the second most frequently reported diagnoses among Asians were schizophrenia and other psychotic disorders (23 percent).

These patterns in variation differed slightly among individuals served aged 18 to 25 with SMI.

- The most frequently reported diagnoses among individuals served aged 18 to 25 of every race and ethnic group with SMI, except for Asian, were depressive disorders; the most frequently reported diagnoses among Asians were schizophrenia and other psychotic disorders (30 percent).

**Education**

- *Tables 3.3a-3.4c.* The most frequently reported diagnoses among individuals served aged 18 to 25 who completed more than 8 grades were depressive disorders, ranging from 28 percent among individuals who completed 9 to 11 grades to 33 percent among individuals who completed more than 12 grades.
- The largest proportion of individuals aged 18 to 25 who completed 0 to 8 grades was in the category for other, unspecified diagnoses (20 percent), but their most frequent specific diagnoses were depressive disorders (18 percent).

**Marital Status**

- *Tables 3.3a-3.4c.* The most frequent diagnoses among individuals served aged 18 to 25 across all marital status categories were also depressive disorders, ranging from 26 percent among never married individuals to 34 percent among currently married, separated, and divorced individuals.

**Living Arrangements**

- *Tables 3.5a-3.6c.* Depressive disorders were the most frequently reported diagnoses among individuals served aged 18 to 25 who lived in a private residence or were in foster care (30 and 23 percent, respectively).
- Bipolar disorders were the most frequently reported diagnoses among individuals served aged 18 to 25 who were homeless or in residential care (28 and 27 percent, respectively).

**SMI Status**

- *Tables 3.5a-3.6c.* The most frequently reported diagnoses among individuals served aged 18 to 25 with SMI were depressive disorders (30 percent).
The most frequently reported diagnoses among young adults served aged 18 to 25 who did not have SMI were other, unspecified diagnoses (27 percent), and the most frequent specific diagnoses were depressive disorders (20 percent).

**Level of Functioning**

*Tables 3.5a-3.6c.* The most frequently reported diagnoses among individuals served aged 18 to 25 who had a Global Assessment of Functioning (GAF) score of 1 to 50 or 51 to 100 were depressive disorders (29 and 28 percent, respectively).

**Employment Status**

*Tables 3.7a-3.8c.* Among individuals served aged 18 to 25, in the 2014 reporting period 21 percent were employed, 32 percent were unemployed, and 47 percent were “not in labor force”. Among those “not in labor force”, approximately two fifths (39 percent) were students.

- The most frequently reported diagnoses among individuals served aged 18 to 25 across each employment status were depressive disorders (ranging from 27 to 35 percent).
- Bipolar disorders were the most frequently reported diagnoses among individuals served aged 18 to 25 whose “not in labor force” status was disabled (31 percent), working in sheltered/noncompetitive employment (26 percent), or retired (25 percent).
- Depressive disorders were the most frequently reported diagnoses among individuals served aged 18 to 25 whose “not in labor force” status was homemakers or students (38 and 26 percent, respectively).

**Timing of Admission**

*Tables 3.9a-3.10c.* The most frequently reported diagnoses among individuals served aged 18 to 25 were depressive disorders, regardless of their timing of admission (29 percent among individuals who were newly admitted to treatment and 24 percent among individuals who were continuing treatment).

**Service Setting**

*Tables 3.9a-3.10c.* The most frequently reported diagnoses differed by mental health service setting. It should be noted that individuals may have received services in more than one service setting during the reporting period, and therefore may be counted in multiple rows in the service setting sections of Tables 3.9a-b and 3.10a-b.

- Bipolar disorders and schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals aged 18 to 25 served in residential treatment centers (25 percent each).
- Depressive disorders were the most frequently reported diagnoses among individuals aged 18 to 25 served in community-based programs (27 percent).
- Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals aged 18 to 25 served in state psychiatric hospitals (40 percent).
Similar patterns were seen among individuals served aged 18 to 25 with SMI.

- Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals aged 18 to 25 served who had SMI and were in state psychiatric hospitals (45 percent), other psychiatric inpatient facilities (33 percent), or residential treatment centers (32 percent).

**SMI Status and Level of Functioning by Service Setting**

*Table 3.11.* In the 2014 reporting period, SMI status and level of functioning varied by service setting among individuals served aged 18 to 25. It should be noted that individuals may have received services in more than one setting during the reporting period, and therefore may be counted in multiple rows in the service setting section of Table 3.11.

- In the 2014 reporting period, a majority (97 percent) of individuals served aged 18 to 25, regardless of SMI status or level of functioning, were treated in community-based programs. Among those treated in a community-based program setting, 67 percent had SMI compared with more than three quarters of individuals served who had SMI and were in a state psychiatric hospital (86 percent) or a residential treatment center (77 percent).

- In the 2014 reporting period, higher proportions of individuals served aged 18 to 25 in community-based programs (46 percent) or residential treatment centers (41 percent) functioned at the 51 to 100 level compared with those in state psychiatric hospitals (25 percent) and in other psychiatric inpatient settings (22 percent).
CHAPTER 4

CHARACTERISTICS OF ADULTS AGED 26 TO 54 RECEIVING MENTAL HEALTH SERVICES: 2014

This chapter presents 2014 reporting period data on adults aged 26 to 54 who received mental health services through the SMHAs. Data on NOMs and clinical measures for all adults are presented by demographic characteristics and mental health diagnoses. Characteristics for the subpopulation of adults with a serious mental illness (SMI) are presented where they differ from the characteristics of all adults.

The mental health diagnoses presented in the chapter tables are adjustment disorders; anxiety disorders; ADD/ADHD; mood disorders—bipolar disorders and depressive disorders; personality disorders; schizophrenia and other psychotic disorders; and other disorders.

Adults Served

Table 4.1 a-c. For the 2014 reporting period, states reported a total of 2,212,988 individuals served aged 26 to 54 (39 percent of all individuals served). Nearly three quarters (72 percent) of these individuals were reported to have SMI.

During that period, the data show mental health diagnoses among adults aged 26 to 54 differed somewhat across categories for several variables, including gender, race, ethnicity, and living arrangements. Mental health diagnoses were largely similar across educational attainment, marital status, SMI status, level of functioning, employment status, and timing of admission.

A comparison of the findings for all adults aged 26 to 54 and the subpopulation of adults aged 26 to 54 with SMI found similar patterns in the distribution of characteristics across most variables for both populations during the 2014 reporting period.

Gender

Tables 4.1a-4.2c. In the 2014 reporting period, individuals served aged 26 to 54 differed slightly in their most frequently reported mental health diagnoses by gender, race, and ethnicity.

- In the 2014 reporting period among males served aged 26 to 54, the most frequently reported diagnoses were schizophrenia and other psychotic disorders (26 percent) and depressive disorders (25 percent).
- Among females served aged 26 to 54 in the 2014 reporting period, the most frequently reported diagnoses were depressive disorders (36 percent) and bipolar disorders (25 percent).

Race

- Tables 4.1a-4.2c. Depressive disorders were the most frequently reported diagnoses for all races served aged 26 to 54 except Asian, ranging from 30 percent among Blacks or African Americans to 35 percent among individuals of “Other” race.
• Among Asians served aged 26 to 54, schizophrenia and other psychotic disorders were the most frequently reported diagnoses (34 percent).

Ethnicity
• Tables 4.1a-4.2c. Depressive disorders were the most frequently reported diagnoses for individuals served aged 26 to 54 of Hispanic origin (35 percent) and non-Hispanic origin (31 percent).

Education
• Tables 4.3a-4.4c. Among individuals served aged 26 to 54, depressive disorders were the most frequently reported diagnoses, ranging from 31 percent among those who completed at most the 8th grade to 34 percent among those who completed more than 12th grade.
• Among individuals served aged 26 to 54 who completed at most the 11th grade, the most frequently reported diagnoses after depressive disorders were schizophrenia and other psychotic disorders and bipolar disorders (21 percent each of those who had completed at most the 8th grade and 23 and 22 percent, respectively, of those who had completed the 9th to 11th grade).

Marital Status
• Tables 4.3a-4.4c. Among individuals served aged 26 to 54, the most frequent diagnoses across all marital statuses were depressive disorders, ranging from 27 percent among those who were never married to 41 percent among those who were widowed.

Living Arrangements
• Tables 4.5a-4.6c. Individuals served aged 26 to 54 who were homeless, lived in a private residence, or had “Other” living arrangements\(^{14}\) were most frequently diagnosed with depressive disorders, ranging from 29 percent of homeless individuals to 34 percent of individuals living in a private residence.
• Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals served aged 26 to 54 who were living in an institutional setting (53 percent), in residential care (47 percent), or in foster care (26 percent).
• The two most frequently reported diagnoses among individuals served aged 26 to 54 who were in jails or correctional institutions were bipolar disorders (21 percent) and schizophrenia and other psychotic disorders (20 percent).

SMI Status
• Tables 4.5a-4.6c. Both individuals served aged 26 to 54 who did and did not have SMI most frequently had diagnoses of depressive disorders (33 and 26 percent, respectively). The second most frequent diagnoses for those without SMI were “Other” (24 percent) and anxiety disorders (20 percent), but for those with SMI the second most frequent diagnoses were bipolar disorders (26 percent) and schizophrenia and other psychotic disorders (23 percent).

\(^{14}\) “Other living arrangements” include crisis residence and other undefined residence.
Level of Functioning

- For individuals served aged 26 to 54 at all levels of functioning, the most frequent diagnoses were depressive disorders (25 percent among those with a GAF score of 0, 31 percent among those with GAF scores of 1 to 50, and 32 percent among those with GAF scores of 51 to 100).

Employment Status

Tables 4.7a-4.8c. In the 2014 reporting period, 21 percent of individuals served aged 26 to 54 were employed, 32 percent were unemployed, and 47 percent were “not in labor force”. The most frequent diagnoses across all employment statuses were depressive disorders.

- Among individuals served aged 26 to 54, the percentage that were employed full time ranged from 11 percent of those with diagnoses of schizophrenia and other psychotic disorders to 40 percent of those with diagnoses of adjustment disorders.

- Among individuals served aged 26 to 54, the percentages that were “not in labor force” ranged from 31 percent of those with diagnoses of adjustment disorders to 63 percent of those with diagnoses of schizophrenia and other psychotic disorders.

Timing of Admission

- Tables 4.9a-4.10c. Among individuals served aged 26 to 54, depressive disorders were the most frequently reported diagnoses across timing of admission (34 percent of individuals who were newly admitted to treatment and 29 percent of individuals who were continuing treatment), and bipolar disorders were the second most frequently reported diagnoses (22 and 24 percent, respectively).

- Adults served aged 26 to 54 reported diagnoses of schizophrenia and other psychotic disorders nearly twice as frequently as adult individuals who were newly admitted to treatment (23 vs. 12 percent).

- Among adults served aged 26 to 54 with SMI, the most frequent diagnoses were also depressive disorders, but the next most frequent diagnoses were bipolar disorders among individuals who were newly admitted to treatment (26 percent) and schizophrenia and other psychotic disorders among individuals who were continuing treatment (28 percent).

- Individuals served aged 26 to 54 who were continuing treatment more frequently had diagnoses of schizophrenia and other psychotic disorders than individuals who were newly admitted to treatment (28 vs. 16 percent).

Service Setting

Tables 4.9a-4.10c. It should be noted that individuals may have received services in more than one service setting during the reporting period and, therefore, may be counted in multiple rows in the service setting sections of Tables 4.9a-b and 4.10a-b.

- Among individuals served aged 26 to 54 who were in a community-based program, the most frequently reported diagnoses were depressive disorders (32 percent), bipolar disorders (23 percent), and schizophrenia and other psychotic disorders (18 percent).
• Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals served aged 26 to 54 who were in state psychiatric hospitals (48 percent), residential treatment centers (43 percent), and other psychiatric inpatient settings (33 percent).

SMI Status and Level of Functioning, by Service Setting

Table 4.11 presents 2014 data on the number and percentage of individuals served aged 26 to 54 by mental health service setting, SMI status, and level of functioning. It should be noted that individuals may have received services in more than one setting during the reporting period, and therefore may be counted in multiple rows in the service setting section of Table 4.11.

• In the 2014 reporting period, about 75 percent of individuals aged 26 to 54 served in community programs and institutions under the justice system had SMI compared with more than 85 percent in other service settings.

• Community programs reported the highest proportions of high functioning individuals served aged 26 to 54 (45 percent had a GAF score of 51 to 100) and the lowest proportion of lowest functioning individuals (5 percent had a GAF score of 0).
Chapter 5
Characteristics of Older Adults Aged 55 and Older Receiving Mental Health Services: 2014

This chapter presents data on individuals aged 55 and older who received mental health services in the 2014 reporting period through the SMHAs. Data on NOMs and clinical measures for older adults are presented by diagnostic categories and mental health diagnoses. Characteristics for the subpopulation of individuals with SMI are presented where they differ from the characteristics of all older adults.

The mental health diagnoses presented in the chapter tables are adjustment disorders; anxiety disorders; delirium, dementia, and other cognitive disorders (delirium/dementia); mood disorders—bipolar disorders and depressive disorders; personality disorders; schizophrenia and other psychotic disorders; and other disorders. Since delirium/dementia diagnoses become significant within this age group, the chapter tracks the reporting of these diagnoses instead of ADD/ADHD, which is a rare diagnosis for this age group.

Older Adults Served
Table 5.1a-c. For the 2014 reporting period, states reported a total of 693,277 individuals served aged 55 and older (12 percent of all individuals). Three quarters (75 percent) of these individuals were reported to have SMI.

During this period, the data show mental health diagnoses differed somewhat across categories for several variables, including gender, race, ethnicity, marital status, living arrangements, SMI status, and service setting. Mental health diagnoses were largely similar across educational attainment, level of functioning, employment status, and timing of admission. A comparison of the findings for all older adults and the subpopulation of older adults with SMI found similar patterns in the distribution of characteristics across most variables for both populations during the 2014 reporting period.

Gender
• Tables 5.1a-5.2c. In the 2014 reporting period, among males served aged 55 years and older, the most frequently reported diagnoses were schizophrenia and other psychotic disorders (32 percent), depressive disorders (30 percent), and bipolar disorders (15 percent).

• Among females served aged 55 years and older during that period, the most frequently reported diagnoses were depressive disorders (41 percent), schizophrenia and other psychotic disorders (21 percent), and bipolar disorders (17 percent).

Race
• Tables 5.1a-5.2c. Depressive disorders were the most frequently reported diagnoses for individuals served aged 55 and older of all races except Blacks or African Americans, ranging from 36 percent of American Indians or Alaska Natives to 49 percent of Asians.
• Schizophrenia and other psychotic disorders were the second most frequently reported diagnoses among individuals served aged 55 years and older for all races except for Blacks or African Americans, ranging from 21 percent of American Indians or Alaska Natives to 27 percent of Native Hawaiians or other Pacific Islanders aged 55 years and older.

• Among individuals served aged 55 years and older who were Black or African American, the two most frequently reported diagnoses were schizophrenia and other psychotic disorders (40 percent) and depressive disorders (30 percent).

**Ethnicity**

• *Tables 5.1a-5.2c.* Depressive disorders were the most frequently reported diagnoses by ethnicity: 36 percent of individuals served aged 55 and older who were not of Hispanic origin and 47 percent of those of Hispanic origin had these diagnoses. Schizophrenia and other psychotic disorders were the second most frequently reported diagnoses by ethnicity.

**Education**

*Tables 5.3a-5.4c.* In the 2014 reporting period, 44 percent of individuals served aged 55 and older had completed 12th grade or had a GED and 28 percent had completed more than 12th grade.

• Among individuals served aged 55 and older, depressive disorders were the most frequently reported diagnoses across all levels of educational attainment, ranging from 36 percent of those who completed 9th to 11th grade to 37 percent each of those who completed 12th grade and more than 12th grade.

• Among individuals served aged 55 and older, 53 percent of those with delirium/dementia had completed 12th grade or had a GED compared with only 44 percent of all individuals served in that age group.

**Marital Status**

• *Tables 5.3a-5.4c.* Depressive disorders were the most frequently reported diagnoses among individuals served aged 55 years and older across most marital status groups, ranging from 39 percent of individuals served who were divorced to 42 percent each of those who were currently married and those who were widowed. Among individuals served aged 55 years and older who never married, the most frequently reported diagnoses were schizophrenia and other psychotic disorders (39 percent).

**Living Arrangements**

• *Tables 5.5a-5.6c.* Similar to all individuals served aged 55 years and older, those who were living in a private residence, were homeless, or had “Other” living arrangements most frequently had reported diagnoses of depressive disorders, ranging from 32 percent among those with “Other” living arrangements to 41 percent among those who were living in a private residence.

• Diagnoses of schizophrenia and other psychotic disorders were most frequently reported among individuals served aged 55 and older who were living in residential care (60 percent), an institutional setting (42 percent), foster care (35 percent), or a jail/correctional facility (28 percent).
SMI Status

• *Tables 5.5a-5.6c.* The mental health diagnoses of individuals served aged 55 years and older varied by SMI status. While individuals served aged 55 and older with or without SMI most frequently had diagnoses of depressive disorders, they differed on their second most frequent diagnoses. Among those with SMI, the second most frequently reported diagnoses were schizophrenia and other psychotic disorders (31 percent); however, among those without SMI the second most frequently reported diagnoses were anxiety disorders (16 percent).

Level of Functioning

• In the 2014 reporting period, while diagnoses of depressive disorders were most frequently reported at all levels of functioning among individuals served aged 55 and older, the proportion with such diagnoses increased with level of functioning.

Employment Status

*Tables 5.7a-5.8c.* In the 2014 reporting period, individuals served aged 55 years and older most frequently reported diagnoses of depressive disorders across all employment statuses. Almost 70 percent of individuals served aged 55 years and older were not in the labor force. Of these, 47 percent were due to disability and 11 percent were retired.

• In the 2014 reporting period, individuals served aged 55 years and older most frequently reported diagnoses of depressive disorders across all employment statuses, ranging from 37 percent among those not in the labor force to 46 percent among those employed full time.

• Schizophrenia and other psychotic disorders were the second most frequently reported diagnoses among individuals served aged 55 years and older who were not in the labor force (30 percent) or unemployed (22 percent). Bipolar disorders were the second most frequently reported diagnoses among individuals served aged 55 years and older who were employed part time (21 percent) or full time (17 percent).

• Nearly half of individuals served aged 55 years and older who were not in the labor force were disabled (47 percent); of these, over one third reported depressive disorders (35 percent) or schizophrenia or other psychotic disorders (34 percent).

Service Setting

*Tables 5.9a-5.10c.* It should be noted that individuals may have received services in more than one service setting and therefore may be counted in multiple rows in the service setting sections of Tables 5.9a-c and 5.10a-c.

• In the 2014 reporting period, the vast majority of individuals served aged 55 and older received treatment in community-based programs. Among individuals served aged 55 and older in community-based programs, the most frequently reported diagnoses were depressive disorders (38 percent).

• Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among older individuals served aged 55 and older in state psychiatric hospitals or residential treatment centers (56 percent each) and in other psychiatric inpatient settings (40 percent).
Timing of Admission

- *Tables 5.9a-5.10a-c.* The most frequently reported diagnoses of individuals served aged 55 and older did not differ by their timing of admission—depressive disorders were the most frequently reported diagnoses for both individuals who were newly admitted to treatment and individuals who were continuing treatment (40 and 35 percent, respectively), and schizophrenia and other psychotic disorders were the second most frequently reported diagnosis (17 and 30 percent, respectively).

- In the 2014 reporting period, individuals served aged 55 and older who had SMI and who were continuing treatment more frequently reported diagnoses of schizophrenia and other psychotic disorders than those who were new admissions (35 vs. 22 percent).

SMI Status and Level of Functioning by Service Setting

*Table 5.11* presents 2014 data on the number and percentage distribution of individuals served aged 55 and older by mental health service setting, SMI status, and level of functioning. It should be noted that individuals may have received services in more than one service setting during the reporting period, and therefore may be counted in multiple rows in the service setting section of Table 5.11.

- In the 2014 reporting period, community programs reported the highest percentage of the five service settings for individuals served aged 55 and older who did not have SMI (23 percent) and the highest percentage of such individuals with GAF scores of 51 to 100 (46 percent). Institutions under the justice system also reported 23 percent of individuals served aged 55 and older who did not have SMI.
Chapter 6

Characteristics of Individuals With Co-Occurring Mental Health and Substance Use Disorders Receiving Mental Health Services: 2014

This chapter presents data on individuals aged 12 and older diagnosed with co-occurring mental health and substance use disorders who received mental health services through the auspices of SMHA in the 2014 reporting period. Data on NOMs and clinical measures for all individuals are presented by demographic characteristics and mental health diagnoses. It should be noted that the definition used for “co-occurring substance use” includes those who have a reported, identified substance use disorder but may not have a formal substance use diagnosis in addition to a reported mental health diagnosis. It should also be noted that data reported in this chapter exclude individuals whose only mental health diagnoses were alcohol- or substance-related disorders.

The mental health diagnoses presented in the chapter tables include adjustment disorders; anxiety disorders; ADD/ADHD; mood disorders—bipolar disorders and depressive disorders; personality disorders; schizophrenia and other psychotic disorders; and other disorders.

Individuals Served

Table 6.1a. For the 2014 reporting period, states reported a total of 741,923 individuals served aged 12 and older (13 percent of all individuals served) had co-occurring mental health and substance use disorders.

During this period, the data show mental health diagnoses differed somewhat across categories for several variables, including gender, age group, race, ethnicity, living arrangements, employment and detailed not in labor force, service setting, and timing of admission. Mental health diagnoses were largely similar across SMI/SED status and level of functioning.

Gender

• Tables 6.1a-c. During the 2014 reporting period, for males served who had co-occurring mental health and substance use disorders, the most frequently reported diagnoses were schizophrenia and other psychotic disorders (25 percent) and depressive disorders (24 percent).

• For their female counterparts, the most frequently reported diagnoses were depressive disorders (32 percent) and bipolar disorders (31 percent).

Age

• The most frequently reported diagnoses for individuals served aged 30 to 44 who had co-occurring mental health and substance use disorders were bipolar disorders (from 29 percent to 30 percent).

• The most frequently reported diagnoses for individuals served aged 45 and older with co-occurring substance use and mental health disorders were depressive disorders (from 30 percent of those aged 45 to 49 to 35 percent of those aged 60 to 64).
Race

- Tables 6.2a-c. In the 2014 reporting period, the individuals served with co-occurring disorders who were American Indian or Alaska Native or White most frequently reported diagnoses of depressive disorders (29 percent and 30 percent, respectively).

- Individuals served with co-occurring disorders who were White equally reported diagnoses of bipolar disorders and depressive disorders (30 percent each).

- During the 2014 reporting period, schizophrenia and other psychotic disorders were the most frequently reported diagnoses for those individuals served who were Asian, Black or African American, or Native Hawaiians or other Pacific Islanders and who had co-occurring mental health and substance use disorders (35, 33, and 28 percent, respectively).

Ethnicity

- Tables 6.2a-c. During the 2014 reporting period, depressive disorders were the most frequently reported diagnoses for individuals served who were of either Hispanic or non-Hispanic origin and who had co-occurring mental health and substance use disorders (26 and 29 percent, respectively).

Substance Use Diagnosis

Tables 6.3a-c. In the 2014 reporting period, mental health diagnoses among individuals served who had co-occurring mental health and substance use disorders differed very little by substance use diagnosis. (Unlike mental health diagnoses, where up to three diagnoses are recorded per client record, each client record contains only one substance use diagnosis. See the final section of Appendix E for definitions of substance abuse codes.)

- Bipolar disorders were the most frequently reported mental health diagnoses for individuals served who had co-occurring marijuana dependence (30 percent) or cocaine dependence (32 percent).

- Depressive disorders were the most frequently reported diagnoses for individuals served who had co-occurring alcohol dependence (35 percent) or non-dependent opioid use (37 percent).

- Bipolar disorders were the most frequently reported mental health diagnoses for individuals served who had co-occurring non-dependent cocaine use (31 percent), non-dependent marijuana use (27 percent), or other non-dependent substance use (28 percent).

- Depressive disorders and bipolar disorders were the most frequently reported diagnoses for individuals served who had co-occurring non-dependent alcohol use (30 and 26 percent respectively).

Living Arrangements

- Tables 6.4a-c. In the 2014 reporting period, depressive disorders were the most frequently reported diagnoses for individuals served who had co-occurring mental health and substance use disorder and were in private residences (30 percent).

- Bipolar disorders and depressive disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and were
homeless (29 percent each). Bipolar disorders were also the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and were in jails and correctional facilities (23 percent).

- Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and were in institutional settings and residential care (48 and 42 percent, respectively).

**SMI/SED Status**

- Tables 6.4a-c. Bipolar disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and SMI (30 percent).

**Level of Functioning**

- Tables 6.4a-c. Bipolar disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and lower levels of functioning (24 percent of those scoring 0 and 29 percent of those scoring 1 to 50 on either CGAS or GAF).

- Depressive disorders were the most frequently reported diagnoses (28 percent) among individuals served who had co-occurring mental health and substance use disorders and higher levels of functioning (a score of 51 to 100).

**Employment Status**

- Tables 6.5a-c. About one third of individuals served who had co-occurring mental health and substance use disorders and who were employed (34 percent) or unemployed (34 percent) most frequently reported diagnoses of depressive disorders.

- Individuals served who had co-occurring mental health and substance use disorders and were not in the labor force most frequently reported diagnoses of bipolar disorders, depressive disorders, and schizophrenia and other psychotic disorders (28 percent each).

- Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and whose “not in labor force” status was disabled (35 percent).

- Bipolar disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and whose “not in labor force” status was working in sheltered/noncompetitive settings (27 percent).

- Depressive disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and who were retired (40 percent) or homemakers (36 percent).

**Service Setting**

*Tables 6.6a-c.* It should be noted that individuals may have received services in multiple service settings during the reporting period, and therefore may be counted in multiple rows in the service setting sections of Tables 6.6a-b.
• In the 2014 reporting period, depressive disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and were in community-based programs (28 percent).

• Schizophrenia and other psychotic disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and were in state psychiatric hospitals (44 percent) or residential treatment centers (34 percent). Schizophrenia and other psychotic disorders (30 percent) and bipolar disorders (30 percent) were reported as the most frequent diagnoses for individuals served who had co-occurring mental health and substance use disorders and were in other psychiatric inpatient settings.

Timing of Admission

• Depressive disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and who were newly admitted to treatment (31 percent).

• Bipolar disorders were the most frequently reported diagnoses among individuals served who had co-occurring mental health and substance use disorders and who were continuing treatment (28 percent).
Chapter 7
MH-TEDS Admissions and Discharges: 2014

This chapter reports on admissions to mental health treatment that received services through the auspices of SMHAs for the 2014 reporting period in six states and jurisdictions—Connecticut [adults only], District of Columbia, Louisiana, Mississippi, Oklahoma, and Puerto Rico—that currently report to MH-TEDS. Most of the variables included in the tables are similar to those included in the tables for earlier chapters, but some of the variables—veteran status, health insurance, referral source—are not available from the states that submitted data via MH-CLD.

The reporting period for 2014 MH-TEDS was July 1, 2013, through June 30, 2014.

There are three subcategories of tables for this chapter: (1) admissions prior to the beginning of the reporting period (i.e., prior to July 2013) that remained in treatment during the reporting period; (2) admissions that started treatment during the reporting period (July 2013 through June 2014); and (3) discharges that exited treatment during the reporting period (July 2013 through June 2014). Tables for admission subcategories present characteristics reported at admission. Tables presenting data on discharges during the reporting period will report by month, service setting, reason for discharge, mental health diagnosis, and days in treatment episode.

Admissions Served

Table 7.1. In the 2014 reporting period, six states (Connecticut [adults only], the District of Columbia, Louisiana, Mississippi, Oklahoma, and Puerto Rico) reported a total of 403,670 admissions to MH-TEDS.

- Fifty-nine percent of admissions received treatment in community programs, 32 percent in state psychiatric hospitals, and 43 percent in institutions under the justice system began treatment prior to the 2014 reporting period.

The distribution of characteristics varied across diagnosis for gender, age, race, employment status, SMI/SED status, level of functioning, and co-occurring mental health and substance use disorders both for admissions who started treatment prior to the 2014 reporting period and admissions that started treatment during the 2014 reporting period, but the distributions themselves were similar for both types of admissions.

Tables 7.2a-c. present the number and percent distribution of admissions by their mental health diagnosis and month of admission. More than half (53 percent) of admissions for individuals in treatment during the 2014 reporting period occurred prior to the reporting period. Within-month diagnosis percentages did not fluctuate strongly for most mental health diagnoses, though fall peaks in adjustment orders (6 percent of all admissions in October 2013), conduct disorder (6 percent in October 2013), and oppositional defiant disorder (6 percent in November 2013) could be observed.
Admissions Continuing in the 2014 Reporting Period

Tables 7.3a-7.9c present the number and percentage distribution of mental health treatment admissions that were admitted to treatment prior to the 2014 reporting period by mental health diagnosis and selected characteristics in the six states and jurisdictions reporting mental health data to MH-TEDS.

- There were a greater number of male than female admissions for ADD/ADHD, conduct disorder, and oppositional defiant disorder. There were a greater number of female than male admissions for adjustment disorders, anxiety disorders, bipolar disorders, and depressive disorders [Table 7.3a].

- More than 40 percent of admissions aged 18 and older had completed 12th grade or a GED [Table 7.5b].

- The majority of admissions for each diagnosis lived in a private residence (ranging from 89 to 99 percent) [Table 7.6b].

- The majority of admissions for each diagnosis had Medicaid coverage (ranging from 72 to 98 percent).

- Nearly three quarters or more of admissions with diagnoses of conduct disorders or ADD/ADHD were “not in labor force” (91 and 72 percent, respectively).

- Admissions with diagnoses of adjustment or anxiety disorders were more likely to be employed (26 and 21 percent, respectively) than continuing mental health admissions overall in the six states and jurisdictions (14 percent) [Table 7.7b].

- Admissions with diagnoses of conduct disorder, ADD/ADHD, oppositional defiant disorder, or adjustment disorders were reported more frequently to have an SED (90, 88, 86, and 58 percent, respectively), than continuing admissions overall in the six states and jurisdictions (20 percent) [Table 7.8b].

- Fewer than 10 percent each of admissions aged 12 and older with diagnoses of conduct disorder and oppositional defiant disorder had a co-occurring mental health and substance use disorder (7 percent each).

Admissions During the 2014 Reporting Period

Tables 7.10a-7.16c present the number and percentage distribution of mental health treatment admissions that started treatment during the 2014 reporting period by mental health diagnosis and selected characteristics in the six states and jurisdictions reporting mental health data to MH-TEDS.

- There were a greater number of male than female admissions for ADD/ADHD, conduct disorder, and oppositional defiant disorder. There were a greater number of female than male admissions for adjustment disorders, anxiety disorders, bipolar disorders, and depressive disorders [Table 7.10a].

- At least 39 percent of admissions aged 18 years or older for each diagnosis completed 12th grade or a GED [Table 7.12b].

- The majority of admissions for each diagnosis lived in a private residence (ranging from 75 to 99 percent) [Table 7.13b].
The majority of admissions for each diagnosis had Medicaid coverage (ranging from 74 to 98 percent).

The majority of admissions for each diagnosis were not veterans (ranging from 95 percent to 100 percent).

Thirty-two percent each of admissions aged 18 years and older diagnosed with adjustment disorders and ADD/ADHD were employed. Thirty percent of admissions that had a diagnosis of ADD/ADHD and were “not in labor force” were students [Table 7.14b].

Admissions with diagnoses of conduct disorder, oppositional defiant disorder, ADD/ADHD, and adjustment disorders were reported more frequently to have an SED (94, 93, 80, and 49 percent, respectively) than admissions during the reporting period overall (15 percent) [Table 7.15b].

While most admissions were referred by an individual such as a family member, friend, or self (ranging from 42 to 60 percent), among referral sources other than individual, the second most frequent referral source was school for admissions that were diagnosed with conduct disorder (20 percent) and ADD/ADHD (15 percent). For those that were diagnosed with adjustment disorders, anxiety disorders, mood disorders, oppositional defiant disorder, and “Other” unspecified disorders, the second most frequent referral was from health care providers [Table 7.16b].

**Discharges During the Reporting Period**

*Table 7.17* presents the number and percentage distribution of mental health treatment discharges by month and mental health service setting for discharges leaving treatment during the 2014 reporting period in the six states and jurisdictions reporting mental health data to MH-TEDS.

*Table 7.18* presents the number and percentage distribution of mental health treatment discharges by mental health service setting, reason for discharge, and days in treatment episode for discharges that left treatment during the 2014 reporting period.

The reason for discharge varied by mental health service setting. Discharges that completed treatment were more frequently reported in state psychiatric hospitals (77 percent), other psychiatric inpatient hospitals (68 percent), and residential treatment centers (50 percent) than in community based programs (23 percent) and institutions under the justice system (13 percent).

The number of days in the treatment episode for discharges varied by mental health service setting. Most treatment episodes in other psychiatric inpatient hospitals and state psychiatric hospitals were 30 days or less (96 and 51 percent, respectively).

*Tables 7.19a-c* present the number and percentage distribution of mental health treatment discharges by mental health diagnosis, reason for discharge, and days in treatment episode for discharges that left treatment during the 2014 reporting period in the six states and jurisdictions reporting mental health data to MH-TEDS.

15 Other disorders are non-missing mental health diagnoses that do not correspond to adjustment, anxiety, ADD/ADHD, conduct, bipolar, depressive, or oppositional defiant disorders (e.g., schizophrenia and other psychotic disorders).
• The reason for discharge varied by mental health diagnosis. Discharges reporting diagnoses of bipolar disorders, adjustment disorders, and depressive disorders were more likely to complete treatment (29, 26, and 26 percent, respectively) than discharges that had diagnoses of anxiety disorders (19 percent) and ADD/ADHD (18 percent).

• The number of days in the treatment episode for discharges varied by mental health diagnosis. More than 36 percent of treatment episodes for “Other” disorders, bipolar disorders, and depressive disorders were 30 days or less (48, 43, and 36 percent, respectively).

CGAS = Children’s Global Assessment Scale; GAF = Global Assessment of Function; SED = serious emotional disturbance; SMI = serious mental illness.

<sup>1</sup> The definitions for SED and SMI status can be found in Appendix D.

<sup>2</sup> Functioning is measured by the Children’s Global Assessment Scale (CGAS) for children and adolescents, and Global Assessment of Function (GAF) for adults. Further information on these measures can be found in Appendix D.

<sup>3</sup> Co-occurring substance use problems are only reported for individuals aged 12 and older.

<sup>4</sup> Total number of individuals aged 12 and older for whom co-occurring substance use problem was reported.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, Treatment Episode Data Set (TEDS) and Client-Level Data (CLD), 2011-2014 reporting periods. Data received through 05.08.15.

ADD/ADHD = attention deficit disorder/attention deficit hyperactivity disorder; GAF = Global Assessment Function; SMI = serious mental illness.

1 "Mental health diagnosis" refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for the individual. This table focuses on the most frequently reported mental health diagnoses for this age group. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 The definition for SMI status can be found in Appendix D.

3 Functioning is measured by the Global Assessment of Function (GAF) for adults. Further information on GAF can be found in Appendix D.

NOTE: Percentages may not sum to 100 percent because of rounding.

ADD/ADHD = attention deficit disorder/attention deficit hyperactivity disorder; GAF = Global Assessment of Function; SMI = serious mental illness.

1. "Mental health diagnosis" refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for the individual. This table focuses on the most frequently reported mental health diagnoses for this age group. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2. The definition for SMI status can be found in Appendix D.

3. Functioning is measured by the Global Assessment of Function (GAF) for adults. Further information on GAF can be found in Appendix D.

ADD/ADHD = attention deficit disorder/attention deficit hyperactivity disorder; SMI = serious mental illness.

¹ "Mental health diagnosis" refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for the individual. This table focuses on the most frequently reported mental health diagnoses for this age group. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

² The definition for SMI status can be found in Appendix D.

³ Individuals could receive services in more than one service setting during the reporting period.

⁴ Mental health service setting category definitions can be found in Appendix B.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, Treatment Episode Data Set (TEDS) and Client-Level Data (CLD), 2014 reporting period. Data received through 05.08.15.

SMI = serious mental illness.

1 “Mental health diagnosis” refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for the individual. This table focuses on the most frequently reported mental health diagnoses for this age group. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 The definition for SMI status can be found in Appendix D.

3 For some states, “Asian” includes “Pacific Islanders.” See Appendix C.

NOTE: Percentages may not sum to 100 percent because of rounding.

GAF = Global Assessment of Function; SMI = serious mental illness.

1 "Mental health diagnosis" refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for the individual. This table focuses on the most frequently reported mental health diagnoses for this age group. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 The definition for SMI status can be found in Appendix D.

3 Functioning is measured by the Global Assessment of Function (GAF) for adults. Further information on GAF can be found in Appendix D.

† Less than one percent of individuals.

SMI = serious mental illness.

1. “Mental health diagnosis” refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for the individual. This table focuses on the most frequently reported mental health diagnoses for this age group. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 The definition for SMI status can be found in Appendix D.

3 Individuals could receive services in more than one service setting during the reporting period.

4 Mental health services setting category definitions can be found in Appendix B.

NOTE: Percentages may not sum to 100 percent because of rounding.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, Treatment Episode Data Set (TEDS) and Client-Level Data (CLD), 2014 reporting period. Data received through 05.08.15.

† Less than one percent of individuals.

GAF = Global Assessment of Function; SMI = serious mental illness.

1 Mental health services setting category definitions can be found in Appendix B.

2 Numbers may not sum to the Total unique individuals column because individuals could receive services in more than one mental health service setting during the reporting period.

3 The definition for SMI status can be found in Appendix D.

4 Functioning is measured by the Global Assessment of Function (GAF) for adults. Further information on GAF can be found in Appendix D.

NOTE: Percentages may not sum to 100 percent because of rounding.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, Treatment Episode Data Set (TEDS) and Client-Level Data (CLD), 2014 reporting period. Data received through 05.08.15.

1 "Mental health diagnosis" refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for the individual. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 The definitions for SMI and SED statuses can be found in Appendix D.

3 Functioning is measured by the Children's Global Assessment Scale (CGAS) for children and adolescents, and the Global Assessment of Function (GAF) for adults. Further information on CGAS and GAF can be found in Appendix D.

NOTE: Percentages may not sum to 100 percent because of rounding.

ADD/ADHD = attention deficit disorder/attention deficit hyperactivity disorder; ODD = oppositional defiant disorder.

1 “Mental health diagnosis” refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for each admission. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 Prior admissions are defined as those episodes of treatment with (1) an admission date prior to the start of the reporting period (July 1, 2013) and (2) a discharge date after the start of the reporting period (July 1, 2013).

3 Private insurance includes the following subcategories: private insurance, Blue Cross/Blue Shield, and health maintenance organization.

- - Less than three admissions.

ADD/ADHD = attention deficit disorder/attention deficit hyperactivity disorder; CGAS = Children's Global Assessment Scale; GAF = Global Assessment of Function; ODD = oppositional defiant disorder; SED = serious emotional disturbance; SMI = serious mental illness.

1 "Mental health diagnosis" refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for each admission. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 Prior admissions are defined as those episodes of treatment with (1) an admission date prior to the start of the reporting period (July 1, 2013) and (2) a discharge date after the start of the reporting period (July 1, 2013).

3 The definitions for SMI and SED statuses can be found in Appendix D.

4 Functioning is measured by the Children's Global Assessment Scale (CGAS) for children and adolescents, and the Global Assessment of Function (GAF) for adults. Further information on CGAS and GAF can be found in Appendix D.

- Less than three admissions.

ADD/ADHD = attention deficit disorder/attention deficit hyperactivity disorder; ODD = oppositional defiant disorder.

1 "Mental health diagnosis" refers to the first-mention mental health diagnosis, which is the first of up to three diagnoses reported for each admission. Mental health diagnostic category definitions can be found in Appendix E: Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes.

2 Admissions during the reporting period are defined as those admissions occurring on or between July 1, 2013 and June 30, 2014.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, Treatment Episode Data Set (TEDS), 2014 reporting period. Data received through 05.08.15.

*n.a.* = Not reporting.
APPENDIX C
MH-TEDS and MH-CLD Data Dictionary of Included Variables

Variable Name: Age
Description: This field is calculated from the client’s date of birth at midpoint of the state’s elected reporting period.
Guidelines: Do not round up age. For example, if the calculated age is 13 and 8 months, report only 13. When the client’s calculated age is less than 12 months, report age as zero. If the reported date of birth of a client changes during the reporting period, use the most recent available information in calculating age.

Variable Name: Competitive Employment Status (Aged 16 +) Employment Status
Description: This data element is reported for all individuals (16 years old and over) who are receiving services in non-institutional settings. Institutional settings include correctional facilities like prison, jail, detention centers, and mental health care facilities like state hospitals, other psychiatric inpatient facilities, nursing homes or other institutions that keep a person, otherwise able, from entering the labor force.

Full Time – use state definition for full time employment; includes members of the Armed Forces, and individuals in full-time Supported Employment.

Part Time – use state definition for part time; includes individuals in part-time Supported Employment.

Unemployed – defined as actively looking for work or laid off from job (and waiting to be recalled) in the past 30 days.

Not in labor force – defined as not employed and not actively looking for work during the past 30 days, includes Homemaker, Student, Retired, Disabled, Other Reported Classification (e.g., volunteers), Sheltered/Not-Competitive Employment, an inmate of an institution.

Guidelines: Employment Status is defined by SAMHSA as an outcome measure and is collected at admission and discharge/update to assess change.

Coding of individuals with overlapping employment statuses: When individuals are engaged in two or more activities (have overlapping status) during the period when their status is collected by the SMHA, use DOL’s system of priorities to determine the appropriate employment status. The prioritization rule is, labor force activities (such as working or looking for work) take precedence over non-labor force activities (such as student and homemaker); and working or having a job takes precedence over looking for work.
Reporting of a person in an internship program: The Individual with Disabilities Education Act (IDEA) ceases to apply for young individuals (18-21 years old) once they received their high school diploma. The following rules should be observed in making determination whether the adult client in an internship program should be reported as ‘Not in the Labor Force’ or ‘Employed’.

1. If the internship is a school requirement, whether paid or not, the person should be considered a “student” (Not In Labor Force).

2. If the internship is not a school requirement, an unpaid position, does not displace regular employees or does not entitle the person for the job at the end of the internship period, then report the person’s status as Not In Labor Force - (Other).

3. If the internship is not a school requirement, paid minimum wage and overtime provision, the employer benefits from the internship through the client’s engagement in actual operations of the business and performing productive work, then the person is employed (Full time or Part time).

Variable Name: Co-occurring Substance Use and Mental Health Disorders

Description: This field indicates whether the client has co-occurring substance use and mental health disorders.

Yes – Client has co-occurring substance use and mental health disorders/diagnoses

No – Client does not have co-occurring substance use and mental health disorders/diagnoses

Guidelines: Reporting of this field is optional.

The assessment of co-occurring substance use and mental health problems may be based on clinical diagnoses, screening results, claims information, or self-report.

Variable Name: Detailed Not In Labor Force

Description: This field provides more detailed information about those individuals who are coded as “Not in labor force” in Employment Status.

Homemaker, Student, Retired, Disabled,

Resident of Institution – Individuals receiving services from institutional facilities such as hospitals, jails, prisons, long-term residential care, etc.

Other – includes volunteer, seasonal worker, other categories used by the state not specified.

Guidelines: Detailed Not in Labor Force is defined by SAMHSA as an outcome measure, and is collected at admission and at discharge/update to assess change.

This field is reported for individuals aged 16 and older whose Employment Status is coded “Not in labor force.”
**Variable Name: Ethnicity**

**Description:** This field identifies whether or not the client is of Hispanic origin.

**Guidelines:** If the ethnicity of a client changes during the reporting period, report the most recent available information at the end of the reporting period.

---

**Variable Name: Gender**

**Description:** This field identifies the client’s most recent reported sex at the end of the reporting period.

**Guidelines:** Report the most recent available information.

---

**Variable Name: Global Assessment of Functioning (adult)/Children’s Global Assessment Scale (Optional)**

**Description:** This field specifies the client’s last known Global Assessment of Functioning (GAF) for adult individuals or Children’s Global Assessment scale (CGAS) score for children and adolescents as reported in Axis V of the DSM.

**Guidelines:** Report only if the state is using the GAF/CGAS.

---

**Variable Name: Health Insurance (MH-TEDS only)**

**Description:** This field specifies the client’s health insurance at admission. The insurance may or may not cover behavioral health treatment.

**Guidelines:** Reporting of this field is optional. States are encouraged to report data for all categories in the list of valid entries, but reporting a subset of the categories is acceptable. Health Insurance should be reported, if collected, whether or not it covers behavioral health treatment.

1. If the state collects a subset of the categories, individuals not fitting the subset should be coded as “Not collected.” For example, if the state collects only Medicare and Medicaid, all other categories of Health Insurance should be coded as “Not collected.”

2. If a state collects Medicare and Medicaid as a single category, Health Insurance should be coded as “Unknown.”

3. If the state does not collect Health Insurance, all records should be coded “Not collected.”

---

**Variable Name: Living Arrangements (Residential Status)**

**Description:** This field specifies client’s residential status at time of admission (new individuals) or start of the reporting period (continuing individuals).

- **Homeless** – person has no fixed address; includes homeless, shelters.
- **Foster Home/Foster Care** – individual resides in foster home. A foster home is a home that is licensed by a county or state department to provide foster care to
children, adolescents, and/or individuals. This includes therapeutic foster care facilities. Therapeutic foster care is a service that provides treatment for troubled children within private homes of trained families.

**Residential Care** – individual resides in a residential care facility. This level of care may include a group home, therapeutic group home, board and care residential treatment, rehabilitation center, or agency-operated residential care facilities.

**Institutional Setting** – individual resides in an institutional care facility with care provided on a 24 hour, 7 days a week basis. This level of care may include skilled nursing/intermediate care facility, nursing homes, institute of mental disease (IMD), inpatient psychiatric hospital, psychiatric health facility, veterans’ affairs hospital, state hospital, or intermediate care facility/MR.

**Jail/Correctional Facility** – individual resides in a jail and/or correctional facility with care provided on a 24 hour, 7 days a week basis. This includes a jail, correctional facility, detention centers, and prison.

**Dependent Living: Private Residence** – adult individuals living in a house, apartment, or other similar dwelling who are heavily dependent on others for daily living assistance.

**Independent Living: Private Residence** – individuals living alone or with others in a private residence and capable of self-care. Includes adult children (age 18 and over) living with parents and adolescents living independently. Also includes individuals who live independently with case management and supported housing support.

**Other** - Other residential status

**Guidelines**:

**Living Arrangements** is defined by SAMHSA as an outcome measure and is collected at admission and at discharge/update to assess change.

---

**Variable Name: Marital Status (Optional Reporting)**

**Description**: This field identifies the client’s marital status. The following categories are compatible with categories used in the U.S. Census.

- **Never married** – includes individuals who are single or whose only marriage was annulled.
- **Currently married** – includes married couples, those living together as married, living with partners, or cohabitating.
- **Separated** – includes those legally separated or otherwise absent from spouse because of marital discord.

**Guidelines**: Report marital status at time of discharge or the most recent available status at the end of the reporting period.

---

**Variable Name: Mental Health Diagnosis**

**Description**: This filed specifies the client’s current mental health diagnoses during the reporting period.
Guidelines: This measure can be reported by using either the *Diagnostic and Statistical Manual of Mental Disorders (DSM)* from the American Psychiatric Association or the *International Classification of Diseases (ICD)* from the World Health Organization.

States should report the most recent mental health diagnoses that are current during the reporting period. Most recent is defined by the date when the diagnosis is reported.

States can report up to three mental health diagnoses by completing the Mental Health Diagnosis 1, 2, and 3 data elements in sequential order.

If the client has more than three most recent mental health diagnoses, use the algorithm below. Use this if the diagnoses are collected through administrative method (i.e., based on the clinician’s evaluation of the person and reported in the client’s case record):

1. Report the primary and secondary diagnoses (if available). If the state does not classify diagnosis into primary/secondary; then
2. Conduct your search for diagnostic codes using both Axis I and II. Report all diagnoses in Axis I (clinical disorders) first followed by diagnosis in Axis II (personality disorders and mental retardation) unless a personality disorder in Axis II was labeled as primary diagnosis, then it should be reported first (note: this method is applicable if using DSM-IV and other earlier editions or if the state continues to use the DSM axial structure;
   If primary/secondary labels and Axis classifications (I and II) are not used by the state, then
3. Report in chronological order starting from the diagnosis that appears on top of the list or first cited in the clinician’s report. Report only mental health diagnosis.

If the state is using claims/encounter data to collect a client’s diagnosis, use the three most frequently reported mental health diagnoses in the client’s service claims/encounters data throughout the reporting period.

Variable Name: Race

Description: This field specifies the client’s most recent reported race at the end of the reporting period.

**Alaska Native** – used in MH-TEDS only

**American Indian or Alaskan Native** – A person having origins in any of the original people of North American South America (including Central America and the original people of Alaska) and who maintain cultural identification through tribal affiliation or community attachment.

**Asian** – A person having origins in any of the following people of the Far East, the Indian, Subcontinent, or Southeast Asia, including Cambodia, China, India, Japan, Korea, Malaysia, Philippine Islands, Thailand, and Vietnam.
Asian or Pacific Islander (temporary code) – older racial category used only by some states that have not yet adopted the OMB recommended racial categories. Between 2011 and 2014, a minority of individuals classified in this report as “Asian” in ten states—Colorado, Iowa, Illinois, Kansas, Kentucky, Louisiana, Maryland, South Carolina, Tennessee, Virginia—were classified by the reporting agency as “Asian or Pacific Islanders,” while the rest were classified as simply “Asian.” In three additional states—North Carolina, New Jersey, Vermont—a majority of individuals classified in this report as “Asian” were classified by the reporting agency as “Asian or Pacific Islanders.”

Black or African American – A person having origins in any of the Black racial groups of Africa.

Hispanic (temporary code) – used in MH-CLD only

Native Hawaiian or Other Pacific Islander – A person having origins in any of the original peoples of Hawaii, Guam, American Samoa, or other Pacific Islander.

White – A person having origins in any of the original people of Europe, North Africa or the Middle East.

Some Other Race Alone – use this category for instances in which the client is not identified in any category above or whose origin group, because of area custom, is regarded as racial class distinct from the above categories (do not use this category for individuals indicating multiple or mixed races).

Guidelines: For states that collect “Other Race” or allow individuals to specify a single race different from the OMB racial categories, use “Some Other Race Alone.” Note that this category should not be used if the client is indicating multiple or mixed race.

[MH-TEDS only] States that collect “Alaska Native” as a separate category should use “American Indian/Alaska Native’ for other American Indians.

In cases where the method of collecting race information differs between community programs and state hospitals, or where the race reported differs between data systems, the state should resolve the issue in accordance to the state business rule in resolving data quality issues. States may use the following guidelines in the absence of a state business rule or to supplement an existing one:

1. Use the most recent race reported if variation in a person’s race was reported by the same provider across time
2. Use the most frequently reported race if variation in a person’s race was reported by different providers across time

Variable Name: Reason for Discharge, Transfer, or Discontinuance of Treatment

Description: This field indicates the outcome of the treatment episode/event or the reason for transfer or discontinuance of treatment.

Treatment Completed – All parts of the treatment plan or program were completed.
Dropped out of Treatment – Client chose not to complete treatment program, with or without specific advice to continue treatment. Includes individuals who drop out of treatment for unknown reasons, individuals with whom contact is lost, individuals who failed to return from leave (“AWOL”), and individuals who have not received treatment for some time and are discharged for administrative purposes.

Terminated by Facility (Administrative Discharge) – Treatment terminated by action of facility, generally because of client non-compliance with treatment or violation of rules, laws, policy, or procedures.

Transferred to another Treatment Program or Facility – Client was transferred to another treatment program, provider, or facility for continuation of treatment.

Incarcerated, or Released by or to Courts – Individuals whose course of treatment is terminated because the client has been subject to jail, prison, or house confinement, or has been released by or to the courts.

Death

Other – Client transferred or discontinued treatment because of change in life circumstances. Example: change of residence, illness or hospitalization, “aging out” of children’s services, completion of MH assessment or evaluation that did not result to referral for a treatment service.

Transferred to another Treatment Program or Facility, but client is no show
Client was transferred to another treatment program, provider, or facility, and it is known that client did not report for treatment.

Transferred to another Treatment Program or Facility that is not in the SSA or SMHA reporting system

Discharged from the state hospital to an acute medical facility for medical services

Variable Name: Referral Source (MH-TEDS only)

Description: This field describes the person or agency referring the client to treatment.

Individual (includes self-referral) – Includes the client, a family member, friend, or any other individual who would not be included in any of the following categories; includes self-referral due to pending DWI/DUI.

Other Health Care Provider – A physician, psychiatrist, or other licensed health care professional; or general hospital, psychiatric hospital, mental health program, or nursing home.

School (Educational) – A school principal, counselor, or teacher; or student assistance program (SAP), the school system, or an educational agency.

Other Community Referral – Community or religious organization or any federal, state, or local agency that provides aid in the areas of poverty relief, unemployment, shelter, or social welfare. This category also includes defense attorneys and self-help groups such as Alcoholics Anonymous (AA), Al-Anon and Narcotics Anonymous (NA).
Court/Criminal Justice Referral/DUI/DWI – Any police official, judge, prosecutor, probation officer or other person affiliated with a federal, state, or county judicial system. Includes referral by a court for DWI/DUI, individuals referred in lieu of or for deferred prosecution, or during pretrial release, or before or after official adjudication, includes individuals on pre-parole, pre-release, work or home furlough or TASC. Client need not be officially designated as “on parole.” Includes individuals referred through civil commitment. Individuals in this category are further defined in Detailed Criminal Justice Referral.

Guidelines: All records with code “Court/Criminal Justice Referral/DUI/DWI” should provide detailed in Detailed Criminal Justice Referral.

Variable Name: School Grade Level – Education

Description: This field specifies the school grade level of three sub-populations of individuals, as follows:

Current grade level for school-age children (3-17 years old and 18-21 years of age if the client is in special education) who attended school at any time in the past three months.

Highest grade level completed for school-age children who have not attended school at any time within the past three months.

Highest educational attainment for all individuals, whether currently in school or not.

Guidelines: Information for this data element should be collected and reported for all individuals. “School” includes, but is not limited to, any one or combination of home-schooling, online education, alternative school, vocational school, or regular school (public, private, charter, traditional, military, magnet, independent, parochial, etc.), at which the child is enrolled in any of the following school grade levels: nursery/preschool (including Head Start), kindergarten, elementary/middle school (Grades 1-8), high school (Grades 9-12, including General Equivalency Degree or GED), vocational school (including business, technical, secretarial, trade, or correspondence courses which are not counted as regular school enrollment and are not for recreation or adult education classes), or college/professional degree.

This measure is to be reported only once during the reporting period, either at time of client discharge or at the end of the reporting period if the client is continuing to receive services.

If the information is collected at the time when the school year just ended, report the recent school grade level completed (not the grade level the child is advancing to in the next school year).

For children who are homeschooled or children in Special Education but have been mainstreamed in regular school grades, please report the equivalent grade level.

“A nursery school is defined as a group or class that is organized to provide educational experiences for children during the year or years preceding kindergarten. It
includes instruction as an important and integral phase of its program of child care. Private homes in which essentially custodial care is provided are not considered nursery schools. Children attending nursery school are classified as attending during either part of the day or the full day. Part-day attendance refers to those who attend either in the morning or in the afternoon, but not both. Full-day attendance refers to those who attend in both the morning and the afternoon. Children enrolled in Head Start programs or similar programs sponsored by local agencies to provide preschool education to young children are counted under nursery school” (The American Community Survey [ACS]).

A person who had reached the age of 18 prior to collecting this information should report the last grade completed, unless they meet the exception criteria for young individuals.

Report the highest educational attainment completed for all individuals 18 years and older (except the young individuals aged 18-21 in Special Education and receiving mental health services from the Children Mental Health System) whether they are currently in school or not.

**Variable Name: Service Setting Status – Mental Health service setting**

**Description:** This field indicates the type of mental health treatment setting(s) in which the client received services throughout the reporting period.

- **State Psychiatric Hospital** – all SMHA-funded and SMHA-operated organizations operated as hospitals that provide primary inpatient care to individuals with mental illness from a specific geographical area and/or statewide.

- **SMHA-Funded/Operated Community-Based Program** – include community mental health centers (CMHCs), outpatient clinics, partial care organizations, partial hospitalization programs, PACT programs, consumer run programs (including Club Houses and drop-in centers), and all community support programs (CSP).

- **Residential Treatment Center** – an organization, not licensed as a psychiatric hospital, whose primary purpose is the provision of individually planned programs of mental health treatment services in conjunction with residential care for children and youth, and in some cases, adult care.

- **Other Psychiatric Inpatient** – a private provider or medical provider licensed and/or contracted through the SMHA. This includes public/private hospitals with separate psychiatric wards.

- **Institutions under the Justice System** – mental health services provided in a jail, prison, juvenile detention center, etc.

**Guidelines:** This data element refers to the place where services were provided and not particularly the residence of the client.
Variable Name: SMI/SED Status

Description: This field indicates whether the client has serious mental illness (SMI) or serious emotional disturbance (SED) using the state’s definition.

Guidelines: Report the most recent available SMI/SED status at the end of the reporting period.

Variable Name: Timing of Admission

Description: This field indicates whether the client is already receiving services at the start of the reporting period (continuing) or is a new admission.

New admission – Admission that happened on the first day of the reporting period or thereafter.

Continuing – Already receiving services at the start of the reporting period. The admission date should have occurred at least a day prior to the start of the reporting period.

Variable Name: Veteran Status (MH-TEDS only)

Description: This field indicates whether the client has served in the uniform services (Army, Navy, Air Force, Marine Corps, Coast Guard, Public Health Service Commissioned Corps, Coast and Geodetic Survey, etc.).

Guidelines: Reporting of this field is optional

A veteran is a person 16 years old or over who has served (even for a short time) but is not on active duty in the U.S. Army, Navy, Air Force, Marine Corps, Coast Guard, or Commissioned Corps of the U.S. Public Health Service or the National Oceanic and Atmospheric Administration, or who served as a Merchant Marine seaman during World War II. Individuals who served in the National Guard or Military Reserves are classified as veterans only if they have ever been called or ordered to active duty (excluding the 4-6 months of initial training and yearly summer camps).

\( ^1 \) The first-mentioned mental health diagnosis is the first of up to three diagnoses reported for the individual. Mental health diagnostic category definitions can be found in Appendix E: Mental Health and Substance Use Diagnosis Codes.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, Treatment Episode Data Set (TEDS). Data received through 05.08.15.
APPENDIX D
SMI/SED FEDERAL DEFINITIONS AND CGAS/GAF SCALE

Serious Mental Illness (SMI)
Pursuant to section 1912 (c) of the Public Health Service Act, as amended by Public Law 102-321 “adult with a serious mental illness” are individuals:

1. age 18 and over;
2. who currently or at any time during the past year, have had a diagnosable mental, behavioral or emotional disorder of sufficient duration to meet diagnostic criteria specified within DSM-III-R; and
3. this disorder has resulted in functional impairment which substantially interferes with or limits one or more major life activities

“These disorders include any mental disorders (including those of biological etiology) listed in DSM-III-R or their ICD-9-CM equivalent (and subsequent revisions), with the exception of DSM-III-R “V” codes, substance use disorders, and developmental disorders, which are excluded, unless they co-occur with another diagnosable serious mental illness…” (p. 29425).

Serious Emotional Disability (SED)
Pursuant to section 1912 (c) of the Public Health Service Act, as amended by Public Law 102-321 “children with a serious emotional disturbance” are individuals:

1. from birth up to age 18;
2. who currently or at any time during the past year have had a diagnosable mental, behavioral, or emotional disorder of sufficient duration to meet diagnostic criteria specified within DSM-III-R; and
3. this disorder resulted in functional impairment, which substantially interferes with or limits the child’s role or functioning in family, school, or community activities (p.29425).

“These disorders include any mental disorder (including those of biological etiology) listed in DSM-III-R or their ICD-9-CM equivalent (and subsequent revisions) with the exception of DSM-III-R ‘V’ codes, substance use, and developmental disorders, which are excluded, unless they co-occur with another diagnosable serious emotional disturbance…” (p. 29425).

“Functional impairment is defined as difficulties that substantially interfere with or limit a child or adolescent from achieving or maintaining one or more developmentally-appropriate social, behavioral, cognitive, communicative, or adaptive skills. Functional impairments of episodic, recurrent, and continuous duration are included unless they are temporary and expected responses to stressful events in their environment. Children who would have met functional impairment criteria during the referenced year without the benefit of treatment or other support services are included in this..."
Global Assessment of Functioning (GAF)

GAF is a numeric scale (0-100) that subjectively rates individuals (18 years old and above) in the areas of social, occupational, and psychological functioning. A higher score means a higher level of functioning. This is reported as Axis V in the Diagnostic and Statistical Manual of Mental Disorders (DSM). Source: MH-CLD Instruction Manual (V. 2.5)

Children’s Global Assessment Scale (CGAS)

CGAS is a numeric scale (0-100) widely used by mental health clinicians to measure the overall severity of disturbance among children under the age of 18. A higher score means higher level of functioning in all areas measured by the instrument (i.e., social, psychological, and occupational functioning of a child). This is reported as Axis V in the Diagnostic and Statistical Manual of Mental Disorders (DSM). Source: MH-CLD Instruction Manual (V. 2.5)

### Appendix D, Table 2. Global Assessment of Functioning (GAF) Scale

<table>
<thead>
<tr>
<th>GAF Range</th>
<th>Description of Level of Functioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>100-91</td>
<td>Superior functioning in a wide range of activities, life’s problems never seem to get out of hand, is sought out by others because of his or her many positive qualities. No symptoms.</td>
</tr>
<tr>
<td>90-81</td>
<td>Absent minimal symptoms (e.g., mild anxiety before an exam), good functioning in all areas, interested and involved in a wide range of activities, socially effective, generally satisfied with life, no more than everyday problems or concerns (e.g., an occasional argument with family members).</td>
</tr>
<tr>
<td>80-71</td>
<td>If symptoms are present, they are transient and expectable reactions to psychosocial stressors (e.g., difficulty concentration after family argument); no more than slight impairment in social, occupational, or school functioning (e.g., temporarily falling behind in school work).</td>
</tr>
<tr>
<td>70-61</td>
<td>Some mild symptoms (e.g., depressed mood and mild insomnia) OR some difficulty in social, occupational, or school functioning (e.g., occasional truancy, or theft within the household), but generally functioning pretty well, has some meaningful interpersonal relationships.</td>
</tr>
<tr>
<td>60-51</td>
<td>Moderate symptoms (e.g., flat and circumstantial speech, occasional panic attacks) OR moderate difficulty in social occupational, or social functioning (e.g., few friends, conflicts with co-workers).</td>
</tr>
<tr>
<td>50-41</td>
<td>Serious symptoms (e.g., suicidal ideation, severe obsession rituals, frequent shoplifting) OR any serious impairment in social, occupational, or school functioning (e.g., no friends, unable to keep a job).</td>
</tr>
<tr>
<td>40-31</td>
<td>Some impairment in reality testing or communication (e.g., speech is at times illogical, obscure, or irrelevant) OR major impairment in several areas, such as work or school, family relations, judgment, thinking, or mood (e.g., depressed man avoids friends, neglect family, and is unable to work, child frequently beats up younger children, is defiant at home, and is failing at school).</td>
</tr>
<tr>
<td>30-21</td>
<td>Behavior is considerably influenced by delusions or hallucinations OR serious impairment in communication or judgment (e.g., sometimes incoherent, acts grossly inappropriately, suicidal preoccupation) OR inability to function in almost all areas (e.g., stays in bed all day, no job, home or friends).</td>
</tr>
<tr>
<td>20-11</td>
<td>Some danger of hurting self or others (e.g., suicide attempts without clear expectation of death, frequently violent, manic excitement) OR occasionally fails to maintain minimal personal hygiene (e.g., smears faces) OR gross impairment in communication (e.g., largely incoherent or mute).</td>
</tr>
<tr>
<td>10-1</td>
<td>Persistent danger of severely hurting self or others (e.g., recurrent violence) OR persistent inability to maintain minimal personal hygiene OR serious suicidal act with clear expectation of death.</td>
</tr>
<tr>
<td>0</td>
<td>Inadequate information</td>
</tr>

</table>

APPENDIX E
MENTAL HEALTH AND SUBSTANCE USE DIAGNOSIS CODES

Mental Health Diagnostic Groups with Corresponding ICD-9 Diagnostic Codes

The listings below group ICD-9 codes into Clinical Classification Software (CCS) mental health “multi-level” diagnostic category codes (5.1, 5.2, and so on;) and their labels (adjustment disorders, anxiety disorders, and so on). Notes:

• Underlined CCS diagnostic groups are displayed in one or more tables in this report; records with ICD-9 codes in other diagnostic groups are grouped together as “other” mental health diagnoses.

• italicized codes in parentheses are nonstandard ICD-9 codes in the data that were recognized to belong to the same CCS mental health diagnostic group.

• Entries in brackets ([650], [651], and so on) are “single level CCS diagnosis categories” that are otherwise ignored in this report but are noted here for convenience.

• The ICD-9 diagnostic codes shown below have omitted the decimal point after the first three digits.

305.30-305.49,
305.70-305.99:  Other Substance Use
APPENDIX F
TERMS AND ACRONYMS

Admission
Admission indicates the beginning of mental health service provision to a person with mental illness though programs under the autopsies of the State Mental Health Agency (SMHA). This includes new admissions (someone who has never received any services from the SMHA) and readmissions (someone who had previously received services from the SMHA, had been discharged, and started receiving services during the reporting period).

ADHD – Attention Deficit Hyperactivity Disorder.
ADHD is a chronic condition marked by persistent inattention, hyperactivity, and sometimes impulsivity. ADHD begins in childhood and often lasts into adulthood.

ADD – Attention Deficit Disorder.
ADD is a condition whose symptoms include impulsiveness and a short attention span. ADHD is a common condition that affects children and adolescents, while ADD is more common in individuals.

CBHSQ – Center for Behavioral Health Statistics and Quality.
A center within the Substance Abuse and Mental Health Services Administration (SAMHSA) under the U.S. Department of Health and Human Services (HHS), CBHSQ is the lead government agency for behavioral health statistics as designed by the Office of Management and Budget (OMB). [Source: http://www.samhsa.gov/about-us/who-we-are/offices-centers/cbhsq].

CD – Conduct disorder.
CD is a serious behavioral and emotional disorder that can occur in children and teens. A child with this disorder may display a pattern of disruptive and violent behavior and have problems following rules.

CGAS – Children’s Global Assessment Scale.
CGAS is a numeric scale (0-100) widely used by mental health clinicians to measure the overall severity of disturbance among children under the age of 18. A higher score means higher level of functioning in all areas measured by the instrument (i.e., social, psychological, and occupational functioning of child). This is reported as Axis V in Diagnostic Statistical Manual of Mental Disorder (DSM).

DSM-5 – Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition.
DSM-5 is the standard classification of mental disorders used by mental health professionals in the United States. DSM consists of three major components: the diagnostic classification, the diagnostic criteria sets, and the descriptive text. [Source: APA https://www.psychiatry.org/psychiatrists/practice/dsm]

GED – General Educational Development.
GED is designed for people who, for various reasons, did not graduate from high school but want a certificate equivalent to the traditional high school diploma.

**ODD** – Oppositional Defiant Disorder.

ODD is a childhood disorder that is characterized by negative, defiant, disobedient, and often hostile behavior toward individuals and authority figures primarily.

**PDD** – Pervasive Developmental Disorders.

PDD refers to a group of conditions that involve delays in the development of many basic skills. Most notable among them are the ability to socialize with others, to communicate, and to use imagination.
