2019-2020 National Survey on Drug Use and Health
National Maps of Prevalence Estimates, by State

The 147 national maps presented here show the 2019-2020 National Survey on Drug Use and Health (NSDUH) estimates for 32 substance use and mental health outcomes, by age group, for 50 states and the District of Columbia. Estimates for youths aged 12 to 17 are not available for past year heroin use because no respondents aged 12 to 17 used heroin in the past year in the 2019 or 2020 NSDUHs. As a result, estimates for people aged 12 or older are also not produced. Thus, maps for these two age groups for past year heroin use are not available.

The color of each state on the U.S. maps indicates how the state ranks relative to other states for each measure. States could fall into one of five groups according to their ranking by quintiles. Because 51 states were ranked for each measure, the middle quintile was assigned to 11 states, and the remaining quintiles were assigned 10 states each. In some cases, a “quintile” could have more or fewer states than desired because two (or more) states had the same estimate (to two decimal places). When such ties occurred at the “boundary” between two quintiles, all of the states with the same estimate were conservatively assigned to the lower quintile. Those states with the highest rates for a given measure are in orange, with the exception of the perceptions of risk measures, for which the lowest perceptions of great risk are in orange. Those states with the lowest estimates are in dark blue, with the exception of the perceptions of risk measures, for which the highest perceptions of great risk are in dark blue. The upper and lower limits of each quintile shown in the map legend collectively define a continuum and are not necessarily the actual values of a particular state. For example, in Figure 1a, the values on the boundary in the lowest quintile correspond to Texas (9.22 percent) and Utah (10.14 percent) and are displayed in the legend. In the next to lowest quintile, New Jersey (10.41 percent) and Louisiana (11.15 percent) are the states with the lowest and highest values; however, in the continuum of the legend, the lower limit was assigned a value of 10.15 percent because the upper limit of the quintile below it is 10.14 percent.

---

1 The seven substance use disorder and treatment need outcomes are based on 2020 NSDUH data only. For details, see Section B of the “2019-2020 NSDUH Guide to State Tables and Summary of Small Area Estimation Methodology” at https://www.samhsa.gov/data/.
